PT   New nucleic acid molecule for use as a marker for screening cancer,
PT   comprises the coding region for a T-type calcium channel and regulatory
PT   sequences associated with the channel.
XX
PS   Claim 21; Page 34; 125pp; English.
XX
CC   The present sequence for 3'-bisulfite PCR primer is used to study the
CC   methylation state of region R6 in a novel human T-type calcium channel
CC   CACNA1G which maps to chromosome 17. The methylation state of specific
CC   regions within CpG islands associated with the CACNA1G gene correlate
CC   with several cancerous phenotypes involving various tissue and cell
CC   types. Since aberrant methylation of normally unmethylated CpG islands is
CC   often observed in immortalised and transformed cells, CACNA1G is
CC   implicated in cellular proliferative disorders e.g. leukaemia,
CC   colorectal, lung, breast and other cancers. The nucleic acid coding for
CC   CACNA1G is useful as a marker for screening cancer and age related
CC   diseases. A diagnostic kit containing primers (AAS01574-AAS01623) for
CC   amplification of a CpG-containing nucleic acid, where the primer
CC   hybridises with a target polynucleotide sequence (AAS01627-AAS01676), can
CC   be used for detecting aberrant methylation. The CpG island sequences
CC   (AAS01677-AAS01692) are selected from genes encoding CACNA1G,
CC   apolipoprotein B (APOB), caudal type homeobox transcription factor 2
CC   (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (FBN1), G
CC   protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B';
CC   HSPA6), RasGAP-related protein (IQGAP2), klotho (KL), proteinase-
CC   activated receptor 2 (PAR2), paired-like homeodomain transcription factor
CC   2 (PITX2), patched A and B (PTCHA; PTCHB) and syndecan 1 and 4 (SDC1;
CC   SDC4) or a MINT31 sequence

PT   Producing sub-population of labeled nucleic acids, useful for analyzing
PT   differences in RNA profiles between several different physiological
PT   sources, using set of distinct gene specific primers.
XX
PS   Example 3; SEQ ID NO 703; 11pp; English.
XX
CC   The invention relates to producing a sub-population of labeled nucleic
CC   acids (NAs) comprising contacting a NA sample from a physiological
CC   source, with a pool of 50 distinct gene specific primers under suitable
CC   conditions to enzymatically generate sub-population of NAs, where each
CC   gene specific primer has a sequence complementary to a distinct mRNA, and
CC   each labeled NA is generated using a single gene specific primer. The
CC   method is useful for producing a sub-population of labeled NAs which is
CC   useful for analysing the differences in the RNA profiles between several
CC   different physiological sources, where the method comprises producing
CC   subpopulation of labeled NAs for the different physiological sources,
CC   comprising the populations for each physiological source to identify
CC   differences in the population, where the comparison is preferably
CC   performed by hybridising the labeled NAs for each of the distinct
CC   physiological sources to an array of probe NAs stably associated with the
CC   surface of a substrate to produce a hybridisation pattern for each of the
CC   sources, and comparing the patterns for each of the sources, where
CC   differential gene expression assays are utilised in differential
CC   expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC   tissue, or different tissue or subtissue types. The present sequence is a
CC   human gene specific PCR primer used in the method of the invention. Note:
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from USPTO
CC   at http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1

PT Novel gene encoding human endometrial specific steroid-binding factor I,
PT II and III which is useful for treating asthma, rhinitis, cystic
PT fibrosis, airway disease and neoplasia.
XX
PS Example 2; Col 34; 36pp; English.
XX
CC This invention relates to nucleic acid molecules encoding portions of the
CC human endometrial specific steroid-binding factors I, II, and III. Also
CC included in the invention are hESF I, II, and III polypeptide sequences.
CC The nucleotide sequence exhibit antiasthmatic, antiinflammatory,
CC antiallergic, and cytostatic properties. The polynucleotides are used in
CC gene therapy to express hESF I, II and III polypeptides in vivo to treat
CC and/or prevent inflammation, asthma, rhinitis, cystic fibrosis, air way
CC disease, neoplasia and atopy. The polynucleotides are also used to
CC inhibit phospholipase A2 activity, bind polychlorinated biphenyls, reduce
CC foreign protein antigenicity, inhibit monocyte and neutrophil chemotaxis
CC and phagocytosis, inhibit platelet aggregation, regulate eicosanoid
CC levels in the human uterus and control the growth of endometrial cells.
CC The polynucleotides are also useful for detecting complementary
CC polynucleotides as a diagnostic reagent. The hESF I, II and III
CC polynucleotides are used to detect complementary polynucleotides such as
CC a diagnostic reagent. Detection of a mutated form of hESF I, II and III
CC associated with a dysfunction will provide a diagnostic tool that can
CC define diagnosis of a disease or susceptibility to a disease which
CC results from under-expression, over-expression or altered expression of
CC hESF I, II and III e.g. a susceptibility to inherited asthma and
CC endometrial cancer. They are also useful for chromosome identification.
CC The present sequence represents a PCR primer used to amplify the hESF I
CC cDNA sequence

PT   New antibody specific for human endometrial specific steroid-binding
PT   factor (hESF) III, useful for detecting hESF III protein in biological
PT   sample and to isolate or identify clones expressing the protein.
XX
PS   Example 2; Col 33; 36pp; English.
XX
CC   PCR primers ABL41790 and ABL41793 were used to amplify cDNA encoding
CC   human endometrial specific steroid-binding factor (hESF) I. The primers
CC   were used to introduce restriction sites for cloning. The full length
CC   hESF I protein has a molecular weight of 9.8 kDa. The protein has
CC   homology to rat prostatic steroid-binding protein. Antibodies which bind
CC   hESF proteins, such as hESF I, hESF II, and hESF III are useful for
CC   isolating or to identify clones expressing the polypeptides or to purify
CC   the polypeptides by affinity chromatography. Agonists and antagonists of
CC   hESF proteins are useful for treating and/or preventing susceptibility to
CC   asthma

PT   New human endometrial specific steroid-binding factor (hESF) proteins and
PT   genes, useful for treating or diagnosing a disease or susceptibility to a
PT   disease, particularly asthma.
XX
PS   Example 2; Page 18; 37pp; English.
XX
CC   The invention discloses isolated polypeptides, which comprise human
CC   endometrial specific steroid-binding factors I, II and III (hESF I, II
CC   and III), and the nucleic acids encoding them. The hESF polypeptide has
CC   homologies to mammalian Clara cell 10 kDa (CC10) secretory protein and
CC   rat prostatic steroid-binding protein which are factors which modulate or
CC   mediate the action of hormones involved in the regulation of functions of
CC   the lung and uterus. The nucleic acids and polypeptides can be used to
CC   identify compounds that bind to and inhibit activation, raise antibodies
CC   or develop antagonists against the isolated hESF polypeptide. The
CC   polypeptides or polynucleotides are useful for treating a patient having
CC   a need of hESF I, hESF II, hESF III or for treating a patient having a
CC   need to inhibit hESF. The polypeptide is administered by providing to the
CC   patient the DNA encoding the hESF polypeptide in vivo (gene therapy). In
CC   particular, the disease is asthma. The hESF polypeptides or
CC   polynucleotides are also useful for diagnosing a disease or a
CC   susceptibility to the disease. The sequence presented is the 3' PCR
CC   primer which was used to amplify hESF I cDNA for expression using
CC   baculovirus expression system T

PT   Process for specifically modulating the properties of an intracellular
PT   target molecule used for the treatment of various disorders.
XX
PS   Example 4; Page 16; 33pp; English.
XX
CC   The present invention relates to a process for specifically modulating
CC   the properties of an intracellular target molecule T, and/or of a
CC   cellular component C which interacts directly or indirectly in a cell
CC   with the target. The process involves the introduction into the cell of a
CC   chimeric molecule known as a targeted effector, comprising a recognition
CC   moiety capable of recognising T and an effector moiety. The chimeric
CC   protein or nucleic acid can be used in the preparation of a medicament
CC   for the treatment of microbial infections, immunological disorders,
CC   neurological disorders, metabolic disorders, psychiatric disorders,
CC   myopathies, genetic disorders, cancer, cardiovascular disorders and
CC   dental disorders. The present sequence is an oligonucleotide used in the
CC   construction of a fusion protein in the exemplification of the invention

PT   New compositions comprising sensor arrays made up of unique probe
PT   oligonucleotides - useful for characterizing a sample of target deletion
PT   oligonucleotides.
XX
PS   Example 1; Page 96; 163pp; English.
XX
CC   This invention describes a novel composition comprising a number of
CC   sensor arrays, where each array comprises a unique probe oligonucleotide,
CC   which is the reverse complement of part of a unique target
CC   oligonucleotide present in a mixture of target deletion sequence
CC   oligonucleotides. The compositions form a method for characterizing a
CC   sample of target deletion oligonucleotides which are labelled and
CC   hybridize with the probe oligonucleotides of the sensor arrays. Such
CC   oligonucleotides and their targets are represented in AAX23548-X23709.
CC   Oligonucleotides characterized by the method form pharmaceutical
CC   compositions that are useful for modulating cellular adhesion or
CC   proliferation, and being active against a eukaryotic pathogen, a human
CC   retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC   retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC   Syncytial Virus or cytomegalovirus (CMV). The compositions enable
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   New DNA sequences from potato, useful for producing plants with altered
PT   properties, e.g. tolerance of flooding, also related proteins, antibodies
PT   and inhibitory sequences.
XX
PS   Example 1; Page 8; 26pp; German.
XX
CC   The invention relates to DNA sequences (I) that encode six specific plant
CC   proteins: (i) a protein (ABP60425) with mitochondrial carrier protein
CC   activity (IIa); (ii) a protein (ABP60426) with transferrin binding
CC   protein activity (IIb); (iii) a protein (ABP60427) with receptor-like
CC   protein kinase activity (IIc); (iv) a protein (ABP60428) with elongation
CC   factor EF-2 activity (IId); (v) a protein (ABP60429) with non-long
CC   terminal repeat retroelement reverse transcriptase activity (IIe); or
CC   (vi) a protein (ABP60430) with helicase activity (IIf). (I), also related
CC   sequences, derived ribozymes and antisense sequences, expression vectors,
CC   encoded proteins and antibodies against the proteins, are used to produce
CC   plants with altered properties, including tolerance of overwatering. The
CC   antibodies are also used for isolation of the proteins and in
CC   immunoassays. Also (I) or their primer or probe fragments are used to
CC   screen for terminators and constitutively, aerobically or anaerobically
CC   inducible plant promoters, specifically for use in potatoes and the
CC   sequence that encodes (IId) is used to alter the translation profile in
CC   plants. Since (I) are derived from potato, their promoters and
CC   terminators provide high level transgene expression in potato, with
CC   improved tissue specificity and inducibility, and can also be used to
CC   control endogenous genes. The present sequence is that of a PCR primer
CC   used in the first strand synthesis of cDNAs derived from Potato

PT   Array containing probes for genes involved in mitochondrial biology,
PT   useful for determining mitochondrial biology gene expression profiles for
PT   use in diagnosing pathologies and identifying biochemical pathways.
XX
PS   Claim 2; SEQ ID NO 3014; 201pp; English.
XX
CC   The invention relates to a novel array comprising at least two isolated
CC   nucleotide molecules, each molecule having a sequence capable of uniquely
CC   hybridising to a nucleic acid molecule which is an expression product of
CC   a gene involved in mitochondrial biology. The array comprises two or more
CC   isolated nucleic acid molecules or spots, each molecule having a sequence
CC   chosen from sequence of 994 human probes and 2046 mouse probes. An array
CC   of the invention is useful for determining an expression profile of a
CC   mouse or human sample containing nucleic acid, by contacting the array
CC   with the sample under conditions allowing selective hybridisation, and
CC   measuring hybridisation of nucleic acid in the sample to the array to
CC   produce an expression profile. The array is also useful for determining
CC   an expression profile of a first labelled sample containing nucleic acid
CC   relative to a second, differently labelled sample containing nucleic
CC   acid. The second sample is a reference or a standard. An array is useful
CC   for determining an expression profile diagnostic of an energy-metabolism-
CC   related physiological condition. An array of the invention is useful for
CC   determining mitochondrial biology gene expression profiles of organisms,
CC   such as human, mice and closely related species, tissue and organs of
CC   such organisms, which are useful for determining expression profiles
CC   diagnostic of energy metabolism-related physiological conditions,
CC   diagnosing such physiological conditions, identifying biochemical
CC   pathways, genes, and mutations involved in such physiological conditions,
CC   identifying therapeutic agents useful for preventing and/or treating such
CC   physiological conditions, evaluating and/or monitoring the efficacy of
CC   such therapies, and creating and identifying animal models of human
CC   energy metabolism-related physiological conditions. An array is also
CC   useful for defining expression signatures or profiles for mitochondrial
CC   diseases, as well as distinguishing clinical disorders that result from
CC   oxidative phosphorylation (OXPHOS) dysfunction, oxidative stress,
CC   apoptosis and aging. An array of the invention contains probes of genes
CC   not previously recognised to participate in mitochondrial biology. The
CC   sequences shown in ADD33224-ADD35260 represent murine mitochondrial DNA
CC   clones used to make the probes of the invention. Some sequences are not
CC   present, these are SEQ ID NO's 295, 1174, 1213, 1700, 1728, 1730, 1905,
CC   1906, 2408 and 2643.

XX
PT   Method for prodn. of cDNA libraries with anchored ends - useful for
PT   subtractive cloning of sequences of interest.
XX
PS   Claim 1; Page 27; 56pp; English.
XX
CC   The invention provides a PCR-based method for generating a full-length
CC   cDNA library with anchored ends. The method uses lock-docking primers
CC   (AAT70106-11), where one primer, poly TV (V = G,C or A) locks over the
CC   polyA tail of eukaryotic mRNA producing first strand synthesis and a
CC   second primer, polyGH (H = A, C or T) locks onto the polyC tail added by
CC   terminal deoxynucleotidyl transferase (TdT). In the final step, AAT70112-
CC   17 (polyAB and polyCD primers; B = G, T or C; D = G, A or T) are used to
CC   amplify the first strand and produce a cDNA library with anchored ends.
CC   cDNA libraries produced may be used to identify new (unique) nucleotide
CC   sequences from PCSUB (PCR-based cDNA subtractive) libraries. The new
CC   method produces discreet sized PCR products which would not necessarily
CC   require further subcloning/screening. The method also produces full-
CC   length cDNA's obtainable from the libraries as opposed to specific cDNA
CC   clones, as produced by previously known methods. Other methods such as
CC   PCR and RACE require a knowledge of the target sequence to be amplified,
CC   by using the PCSUB method no previous knowledge is necessary

PT   Use of heparin sulphate/heparin interacting protein - for modulating
PT   blood coagulation, e.g. for neutralising heparin, treating diseases
PT   involving excessive bleeding or administration to wound sites.
XX
PS   Example 1; Page 78; 148pp; English.
XX
CC   A method has been developed for identifying a heparin (Hp) component that
CC   binds to antithrombin-3 (AT-3). The method comprises:(a) contacting a Hp
CC   sample suspected of containing a Hp component that binds to AT-3 with a
CC   heparan sulphate (HS)/Hp interacting protein (HIP) to allow binding of
CC   the Hp component; and (b) detecting the binding of the Hp component to
CC   the HS/HIP. The present sequence represents a primer for reverse
CC   transcriptase PCR of heparan sulfate/heparin interacting protein
CC   (HS/HIP). Products from the present invention can be used for modulating
CC   blood coagulation. They can be used for neutralising heparin, treating
CC   diseases characterised by excessive bleeding or administration to wound
CC   sites. The HS/HIPs can also be used for the production of antibodies and
CC   in diagnostic applications

PT   Isolated nucleic acids encoding the bee venom protein PX3.101 useful for
PT   treating autoimmune and inflammatory disorders such as rheumatoid
PT   arthritis.
XX
PS   Example 3; Page 43; 83pp; English.
XX
CC   The present primer was used for cDNA encoding the protein PX3.101, which
CC   is a honey bee venom isolated Apis mellifera. PX3.101 inhibits the
CC   binding of interleukin-8 (IL-8) to its receptor (e.g. CXCR1 and CXCR2)
CC   and inhibits a variety of enzymes (e.g. cyclooxygenases, lipoxygenases,
CC   phospholipases and proteases) associated with inflammatory diseases. The
CC   nucleic acids may be used for the recombinant production of PX3.101
CC   proteins either in vivo (as part of a gene therapy protocol) or in vitro
CC   (as a fermentation culture). The nucleic acids may also be used as probes
CC   to identify similar sequences in samples. The PX3.101 protein may be used
CC   for the treatment of inflammatory diseases, cancers, autoimmune diseases,
CC   pain and/or diseases associated with chemokine (especially IL-8)
CC   imbalances such as rheumatoid arthritis, multiple sclerosis, psoriasis,
CC   systemic lupus erythematosus (SLE), Crohn's disease, vasculitis,
CC   scleroderma, metastatic cancer and Alzheimer's disease in humans. It is
CC   also disclosed that the proteins may be used to accelerate wound healing,
CC   reduce several aging processes and protect against ultraviolet light. The
CC   proteins may also be used as antigens in the production of antibodies
CC   specific for PX3.101. The antibodies may be used as diagnostic agents to
CC   detect PX3.101 protein in samples and to down regulate PX3.101 activity

PT New polynucleotide for the amplification of a one-side single-stranded
PT DNA and the production of a double-stranded cDNA comprises a single-
PT stranded DNA primer.
XX
PS Disclosure; Page 11; 13pp; Japanese.
XX
CC The present invention describes a single-stranded DNA primer comprising a
CC single-stranded DNA having a dTn sequence, which hybridises with the
CC polyA site of an mRNA at the 3'-terminal, and has a blocking group at the
CC 5'-terminal in which the other part constitutes an adapter double-
CC stranded DNA connected to the double-stranded cDNA. The terminal of the
CC side of the DNA is not connected to the double-stranded cDNA, which
CC consists of a base sequence having full homology to the single-stranded
CC DNA corresponding to the 5'-terminal. A method is also described for the
CC preparation of a double-stranded cDNA in which the above single-stranded
CC DNA primer is hybridised with the polyA site of an mRNA and said single-
CC stranded DNA primer is used as the primer to reverse-transcribe said mRNA
CC and further it is converted to a double-stranded cDNA by a DNA
CC polymerase. The primer is used for the uniform amplification of DNAs. The
CC present sequence represents a PCR primer which is given in the
CC exemplification of the present invention

PT   New altered CD40L promoter for use in the study, diagnosis and treatment
PT   of a variety of inflammatory disorders and autoimmune diseases, such as
PT   rheumatoid arthritis.
XX
PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT   Thrombopoietin polypeptide which specifically stimulates or increases
PT   platelet production - useful in treatment of thrombocytopenia, also
PT   related DNA and vectors.
XX
PS   Example 19; Page 127; 383pp; English.
XX
CC   AAQ99576-Q99584 represent amplification primers based on regions of the
CC   human thrombopoietin (TPO) cDNA (see AAQ99552). These sequences were used
CC   to obtain a full length TPO sequence, as AAQ99552 did not have a complete
CC   3' terminus. TPO is a humoral factor capable of promoting platelet
CC   production. The protein encoded by the full length sequence can be
CC   purified by using a gel affinity column where Mpl has been coupled to a
CC   resin. AAQ99551 and AAQ99553 also encode TPO proteins. The DNA sequences
CC   are inserted into vectors which are used to transform prokaryotic and
CC   eukaryotic host cells. Using the proteins encoded by these sequences, and
CC   derivatives of them, antibodies specifically immunoreactive with a TPO
CC   protein can be created. The antibodies, DNA sequences and vectors are
CC   used to isolate the protein sequences. The TPO proteins can then be used
CC   in the treatment of platelet disorders. These include thrombocytopenia,
CC   hypoplastic anaemia, AIDS, disseminated intravascular coagulation
CC   syndrome and thrombotic thrombocytopenia. (Updated on 25-MAR-2003 to
CC   correct PR field.)

PT   New normalised directional cDNA libraries - used for isolating novel
PT   cDNA's, including tissue-specific and development-specific DNA.
XX
PS   Disclosure; Page 45; 186pp; English.
XX
CC   Human tissues were obtained for construction of a variety of cDNA
CC   libraries, including infant brain, adult brain and adult hippocampus.
CC   Each of the cDNA libraries had a characteristic sequence identifier,
CC   provided by the oligonucleotide utilised to prime first strand cDNA
CC   synthesis (see AAQ87894-Q87907 for these primer sequences; all these
CC   primers have the PacI restriction site for directional cloning of cDNAs).
CC   Each of the libraries was propagated in the form of single-stranded (ss)
CC   circles and normalised separately by a novel method. The method
CC   comprises: generating fragments complementary to the 3' non-coding
CC   sequence of the ss circles in the library to produce partial duplexes;
CC   purifying the partial duplexes; melting and reassociating them to
CC   appropriate Cot; and purifying the unassociated ss circles to generate a
CC   normalised cDNA library. (Updated on 25-MAR-2003 to correct PN field.)

CC   nodorum / Phaeosphaeria nodorum , Septoria tritici ), Thielaviopsis (e.g.
CC   Thielaviopsis basicola ), Uncinula (e.g. Uncinula necator ), Venturia
CC   (e.g. Venturia inaequalis ) or Verticillium (e.g. Verticillium dahliae ,
CC   Verticillium albo-atrum ). Mutations in the proteolytic consensus
CC   sequences contained within FCWP1 provides improved stability of its
CC   antifungal activity. Also disclosed are ribosomal proteins with similar
CC   PI (>7|) and molecular weight (<20kDa) to FCWP1, which may act as
CC   antifungal proteins. The present sequence is a PCR primer used to isolate
CC   cDNA for FCWP1. Note: The sequence data for this patent did not form part
CC   of the printed specification, but was obtained in electronic format
CC   directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6573361B1.

PT   Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT   sample comprising the complex with ligand that binds to a component of
PT   the complex and separating complex by binding ligand with a binding
PT   molecule.
XX
PS   Example 6; Page 30; 49pp; English.
XX
CC   The specification describes a method for partitioning endogenous cellular
CC   mRNA-protein (mRNP) complexes. The method comprises contacting a
CC   biological sample comprising mRNP complex with ligand that specifically
```

```
CC   binds a component of mRNP complex, separating mRNP complex by binding the
CC   ligand with a molecule specific for ligand, which is attached to the
CC   solid support and then collecting the mRNP complex by removing the
CC   complex from the support. The method is useful for in vivo partitioning
CC   of cellular mRNA protein complexes in a biological sample. The method is
CC   useful for determining the ribonomic profile of a cell which has numerous
CC   uses including monitoring of tumour development, state of growth or state
CC   of development, perturbations of a biological system such as disease,
CC   drug or toxin treatment and the state of cell aging or death,
CC   distinguishing ribonomic profiles among organisms, to discriminate
CC   between transcriptional and post-transcriptional contributions to gene
CC   expression and to track the movement of RNAs through RNP complexes,
CC   including the interactions of combinations of proteins with RNAs in RNP
CC   complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC   untranslated region (UTR) of mRNA of various genes. The sequences contain
CC   target sequences for RNA-binding proteins

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 2; Col 45; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
```

```
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

PT   New detectably labelled oligonucleotide multimer, comprising multiple
PT   contiguous copies of a repeated oligonucleotide - useful for detecting
PT   target molecules in diagnosis and medicinal applications.
XX
PS   Example 2; Page 41; 103pp; English.
XX
CC   The present invention describes a detectably labelled oligonucleotide
CC   multimer, comprising multiple contiguous copies of a repeated
CC   oligonucleotides. The detectably labelled oligonucleotide multimer is
CC   useful for detecting a target molecule. Oligonucleotide multimers may be
CC   produced in sufficient quantity to be useful for diagnostic and medical
CC   applications. The multimers are useful for affinity labelling of
CC   proteins, and for signal amplification in highly sensitive affinity
CC   capture and sequence identification applications. The method provides a
CC   faster, cheaper and simpler way for large-scale production of DNA and RNA
CC   oligomers and multimers. The incorporation of labels enables the
CC   oligonucleotide multimers to be useful in diagnostics and medicine. The
CC   present sequence represents an oligonucleotide used in an example from
CC   the present invention

PT   Measuring telomerase activity, useful for tumour diagnosis and compound
PT   screening - by extending substrate primer, followed by amplification and
PT   immobilising product for detection.
XX
PS   Example; Page 11; 21pp; German.
XX
CC   The present sequence is a telomerase Oliog-dT-Primer, which can be used
CC   in a novel method for detecting telomerase activity. The method comprises
CC   adding to a test sample a 1st primer, that serves as telomerase
CC   substrate, and nucleoside triphosphate (dNTP) and incubating to allow
CC   primer extension by the telomerase, amplifying the extension product,
CC   immobilising the amplification product (AP) on a solid phase and
CC   qualitative and/or quantitative detection of AP, where the substrate
CC   primer is preferably from the 5'-region of the long terminal repeat 2
CC   (LTR-2) sequence of a retrovirus. The method can be used to diagnose
CC   tumours and screen compounds for effector activity. Immobilisation of AP
CC   provides a signal that is reproducibly representative of telomerase
CC   activity, eliminates the need for gel electrophoretic separation and
CC   provides high sensitivity. Radioactive labels are not required and the
CC   method can be automated for routine use. Specific detection is achieved
CC   by proper choice of hybridisation conditions, without separation of the
CC   telomerase extension product. A specific signal is generated by 1-10 cell
CC   equivalents, but for tumour analysis 10-1000 ng of tissue is usually used

CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT dysplastic lesions, endometriosis or graft versus host disease.
XX
PS Disclosure; Fig 7; 605pp; English.
XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

XX
CC   The present invention relates to a method for stimulating an immune
CC   response. The method comprises administering an immunostimulatory nucleic
CC   acid to a non-rodent subject in sufficient quantity to stimulate an
CC   immune response. The present sequence is one such immunostimulatory
CC   nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC   (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC   against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC   and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC   haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC   staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC   also useful for preventing cancer, asthma, infectious disease, allergy or
CC   immune deficiency. The present sequence can also be used to redirect a
CC   Th2 to a Th1 immune response and to activate immune cells. Note: the
CC   present sequence may have a phosphorothioate backbone

PT   Testing for the presence of polymorphisms associated with inflammatory
PT   bowel disease, using a hybridization assay.
XX
PS   Claim 1; Page 76; 463pp; English.
XX
CC   The present invention describes a method for detecting the presence of
CC   polymorphisms associated with inflammatory bowel diseases such as
CC   ulcerative colitis and Crohn's disease. The methods can be used to detect
CC   the presence of genetic polymorphisms associated with inflammatory bowel
CC   disease and correlating their occurrence with disease states. They may be
CC   used in this way for phenotypic correlations, forensics, paternity
CC   testing, medicine and genetic analysis. The present sequence is a
CC   polymorphic site described in the exemplification of the invention

PT disease by administering an immunostimulatory nucleic acid.
XX
PS Disclosure; Page 10; 229pp; English.
XX
CC The invention describes a method of treating non-allergic inflammatory
CC disease comprising administering to a subject having or at risk of
CC developing a non-allergic inflammatory disease an immunostimulatory
CC nucleic acid for prevention or treatment of the disease. The method is
CC useful for treating non-allergic inflammatory diseases, such as
CC psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
CC inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.
CC This sequence represents an immunostimulatory nucleic acid

PT Pure and recombinant human Telomerase Reverse Transcriptase and its
PT variants - are useful in the diagnosis, prognosis and treatment of cell
PT proliferation conditions especially cancer and ageing.
XX
PS Disclosure; Page 41; 387pp; English.
XX
CC The present sequence represents a PCR primer from the present invention
CC which describes human telomerase reverse transcriptase (hTRT). The
CC present invention also describes the following methods: (A) determining
CC whether a test compound is a modulator of hTRT, by detecting the change
CC in hTRT recombinant protein or polynucleotide, on administration of the

```
CC   compound; (B) preparation of recombinant telomerase by contacting a
CC   protein preparation of hTRT with a telomerase RNA component; (C)
CC   detection of the hTRT RNA or protein in a sample by binding a relevant
CC   probe to the sample and detecting the complex formed or in the case of
CC   RNA detection, amplifying the product and correlating the presence of
CC   complex or amplification product with presence of hTRT in the sample; and
CC   (D) increasing the proliferation of a vertebrate cell by increasing hTRT
CC   expression; and (E) the use of an agent that causes an increase in cell
CC   vertebrate cell proliferation to create a medicament that inhibits
CC   ageing. A protein preparation of hTRT and the polynucleotide encoding
CC   hTRT can be used in the manufacture of medicaments for inhibiting the
CC   effect of ageing or cancer. Inhibitors of telomerase activity can be used
CC   to treat conditions that are associated with high telomerase activity. A
CC   protein preparation of hTRT can also be used in the new methods

PT   New genotyping oligonucleotide, useful for detecting the presence,
PT   absence or identity of single polynucleotide polymorphism in a nucleic
PT   acid sample.
XX
PS   Claim 1; Page 55; 83pp; English.
XX
CC   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC   primer extension (SNPE) primers, and the sequences of regions flanking
CC   sites of single nucleotide polymorphisms SNPs. The present invention
CC   includes kits for determining the presence or absence of a SNP, using the
CC   oligonucleotides of the invention. The PCR primers are used to amplify a
CC   SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC   The oligonucleotides are useful for genotyping a nucleic acid sample by
CC   performing a single-nucleotide primer extension reaction. The
CC   oligonucleotides are useful for determining the presence, absence or
CC   identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC   assess by association analysis the genotype of an individual or group of
CC   individuals, having a pathological phenotypic trait suspected of being
CC   caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC   osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC   traits also include symptoms of or susceptibility to multifactorial
CC   disease of which a component is or may be genetic such as autoimmune
CC   diseases, including, rheumatoid arthritis, multiple sclerosis,
CC   inflammation, cancer, nervous system diseases and infection by pathogenic
CC   microorganism. The method is also useful in forensic investigations and
CC   paternity analysis. The present sequence represents a single nucleotide
CC   primer extension (SNPE) primer specific for a human SNP containing DNA
CC   sequence

PT   Determining mRNA expression in sample, by producing shortened amplicons
PT   from mRNA isolated from sample, electronically hybridizing amplicons to
PT   probes bound to a support, and detecting the amount of hybridized
PT   amplicons.
XX
PS   Example 6; Page 13; 37pp; English.
XX
CC   The invention relates to detecting (M1) relative amounts of at least 2
CC   mRNA sequences in a biological sample (BS), comprises isolating mRNA from
CC   BS, amplifying at least 2 mRNA transcripts from each BS to produce
CC   amplicons (A) less than about 300 bases in length, electronically
CC   hybridising (A) to at least 2 probes bound to a support at predetermined
CC   locations, and detecting amounts of each (A) hybridised to the bound
CC   probes. Also included are (1) preserving (M2) and reusing a nucleic acid
CC   library produced from a patient biological sample, by: (a) isolating mRNA
CC   from a patient biological sample; (b) reverse- transcribing the mRNA to
CC   produce a cDNA library; (c) amplifying the cDNA library by a DNA
CC   polymerase reaction utilising at least one chimaeric primer comprising a
CC   RNA polymerase recognition site upstream of a sequence specific for a
CC   mRNA transcript of interest and a fill-in primer for the complementary
CC   nucleic acid strand chosen from sequence specific primers and random
CC   primers (at least 1 of the primers used is chosen from 5' affinity-moiety
CC   labeled chimaeric primers and 5' affinity-moiety labeled sequence
CC   specific fill-in primers); (d) binding the amplification products to a
CC   solid support coated with an affinity-binding moiety; (e) utilising the
CC   bound amplification products as a template for an in vitro transcription
CC   reaction; (f) separating the in vitro transcription products from the
CC   amplification products bound to the solid support; and (g) utilising the
CC   bound amplification products from step (h) as a template for at least one
CC   additional in vitro transcription reaction (the amount of in vitro
CC   transcription product produced is not significantly less than that
CC   produced in step (e)); (2) detecting (M3) the extent of hybridisation of
CC   a nucleic acid in a sample to a probe nucleic acid sequence; and (3)
CC   providing (M4) an internal control for an individual test site in a
CC   nucleic acid hybridisation reaction assay to determine the presence of at
CC   least one nucleic aid sequence of interest in at least one nucleic acid
CC   containing sample (the nucleic acid hybridisation assay is performed on
CC   an electronically controlled microarray comprising at least two test
CC   sites). M1 Is useful for detecting the relative amounts of at least two
CC   mRNA sequences in a biological sample. M1 is useful for determining the
CC   level of mRNA expression in the cells of a biological sample, for
CC   gathering data to correlate difference in expression patterns with
CC   specific physiological and/or pathological states, for studying
CC   expression of genes in organisms under various physiological conditions,
CC   for studying the role of gene expression in diseases and oncogenesis,
CC   physio-chemical cellular responses to stimuli, and cell growth and
CC   differentiation, for titrating the amount of amplified mRNA present in a
```

```
CC   sample, and to compare, side by side, the expression levels of mRNA in a
CC   cell type that has undergone two physical or chemical stimuli. The method
CC   uses primer extension and an active electronic microarray. The present
CC   sequence is a gene specific primer used in the method of the invention

PT   Detecting a target nucleotide sequence in an analyte, for use in e.g.
PT   drug discovery, comprises using a set of features having
PT   oligophosphodiester probes, and subtracting a background signal from an
PT   observed signal.
XX
PS   Claim 5; Page 19; 35pp; English.
XX
CC   The invention relates to a method for detecting the presence and/or
CC   amount of a target nucleotide sequence in an analyte. The method
CC   comprising: contacting an aliquot of an analyte suspected of containing
CC   the target sequence with a set of features comprising oligophosphodiester
CC   probes; and subtracting a background signal from an observed signal to
CC   determine the presence and/or amount of the target sequence in the
CC   analyte. The method is used to detect the presence and/or amount of a
CC   target sequence in an analyte. The method is used for estimating
CC   background noise in a nucleic acid hybridisation assay and for validating
CC   a test-background feature. The method is useful in chemical, biological
CC   medical and diagnostic techniques, and for drug discovery. The present
CC   sequence is a probe targetted to human tumour suppressor p53 gene

PT   New isolated nucleic acid encoding an isoform of human pregnancy
PT   associated plasma protein E, for preventing or aborting pregnancy.
XX
PS   Example 2; Page 312; 353pp; English.
XX
CC   This invention describes a novel isolated nucleic acid that encodes one
CC   of three new isoforms of human pregnancy associated plasma protein E,
CC   hPAPP-E. The products of the invention have abortive and contraceptive
CC   activity and can be used for gene therapy or in a vaccine. The nucleic
CC   acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC   used in pharmaceutical compositions or vaccines for preventing or
CC   aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC   dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC   the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC   antibodies can be used to assess the expression levels of PAPP-E isoform
CC   proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC   antenatally. This sequence represents an oligomer used in scanning the
CC   human PAPP-E genes described in the disclosure of the invention

PT Nucleic acid arrays for qualitatively or quantitatively determining the
PT presence of analyte target nucleic acid in a sample comprises both
PT hybridization features and background features.
XX
PS Claim 8; Page 15; 38pp; English.
XX
CC The invention relates to a nucleic acid array (I) comprising at least one
CC hybridisation feature and at least one background feature. (I) is useful
CC for detecting the presence of an analyte nucleic acid in a sample. The
CC detection comprises contacting the nucleic acid array with the sample
CC under stringent hybridisation conditions, subtracting the background
CC signal from the hybridisation signal to obtain a background corrected
CC hybridisation signal and relating the background corrected hybridisation
CC signal to the presence of the analyte target nucleic acid in the sample
CC The method further comprises a labeling step comprising labeling any
CC analyte target nucleic acids present in the sample with a member of a
CC signal producing system prior to contacting the array with the sample.
CC ABK99529-ABK99544 and ABK99549-ABK99578 represent nucleic acid probes of
CC the invention

PT   Detecting relative amounts of at least two different mRNAs in biological
PT   samples by electronically hybridizing amplicons to probes, useful to
PT   monitor gene expression in disease and in cell response studies.
XX
PS   Example 6; Col 45; 36pp; English.
XX
CC   The invention relates to a method for detecting the relative amounts of
CC   at least two different mRNA sequences in biological samples. The method
CC   comprising isolating sample mRNA, amplifying at least two mRNAs to
CC   produce amplicons of not more than 300 bases, electronically hybridising
CC   the amplicons to probes bound to a support at predetermined locations and
CC   detecting amounts of hybridised amplicons. The method may be used to
CC   monitor gene expression in the study of disease and oncogenesis, physio-
CC   chemical cellular responses to stimuli and cell growth and
CC   differentiation. The present sequence is a human PCR primer used for
CC   amplifying p53 target gene

PT   New GPCR-A-1 nucleic acid and polypeptide, useful for diagnosing,
PT   investigating and/or treating disorders associated with aberrant
PT   expression or activity of GPCR-A-1, such as tumors and cancers.
XX
PS   Example 2; SEQ ID NO 629; 156pp; English.
XX
CC   The invention describes an isolated nucleic acid encoding a G protein
CC   coupled receptor (GPCR), mutations of which cause cancer, comprising a
CC   2225 or 1921 base pair sequence, or their degenerate variants, encoding a
CC   409 residue amino acid sequence, all given in the specification, with or
CC   without conservative amino acid substitutions, or complements of the
CC   sequence of them. The encoding nucleic acid is not more than 100 kbase in
CC   length. The methods and compositions of the present invention are useful
CC   for diagnosing, investigating and/or treating disorders associated with
CC   aberrant expression or activity of GPCR-A-1, such as tumours and cancers.
CC   This sequence represents an oligonucleotide used to analyse the gene
CC   encoding human G-protein coupled receptor GPCR-A-1

XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

```
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   Detecting relative amounts of at least two mRNA utilizing microelectronic
PT   arrays in a sample, useful for studying disease and oncogenesis, physio-
PT   chemical cellular responses to stimuli, and cell growth and
PT   differentiation.
XX
PS   Example 6; Page 14; 39pp; English.
XX
CC   The invention describes a method of detecting the relative amounts of at
CC   least two mRNA sequences in at least one biological sample, comprising:
CC   (a) isolating mRNA from the sample; (b) amplifying at least two mRNA
CC   transcripts to produce amplicons; (c) electronically hybridising the
CC   amplicons produced to at least two probes bound to a support at
CC   predetermined locations; and (d) detecting the amounts of each amplicon
CC   hybridised to the bound probes at the predetermined locations. The
CC   methods and compositions are useful for utilising gene expression
CC   experimental models for use in studying disease and oncogenesis, physio-
CC   chemical cellular responses to stimuli, and cell growth and
CC   differentiation. This sequence represents an oligonucleotide targeted to
CC   a human gene and used to demonstrate the methods described in the
CC   invention

XX
CC   The present invention describes a stress responsive gene promoter
CC   isolated from Saccharomyces cerevisiae (yeast). Also described in the
CC   present invention are: (1) a promoter containing a DNA hybridising with
CC   the above DNA under a stringent condition and having stress-responsive
CC   promoter activity; (2) a gene expression cassette containing the above
CC   promoter; (3) an expression vector containing the above gene expression
CC   cassette; (4) a recombinant vector in which a gene encoding an optional
CC   polypeptide is recombined to the above expression vector; (5) a
CC   transformant containing the above recombinant vector; and (6) a method
CC   for the preparation of the above polypeptide in which the above
CC   transformant is cultured and the polypeptide is collected from the
CC   resultant culture. Saccharomyces cerevisiae is used for the brewing of
CC   beer, wine and sake and production of bread. The gene is responsive to
CC   the stresses such as oxidative stress, osmotic pressure stress and
CC   glucose starvation stress. The present sequence represents a PCR primer
CC   for the yeast DOG2 stress responsive gene, which is used in an example
CC   from the present invention

PT   Synthetic oligo-nucleotide(s) which bind target duplex DNA - forming co-
PT   linear triplex to control transcription process in gene-specific fashion.
XX
PS   Claim 47; Page 31; 40pp; English.
XX
CC   Sequence forms triplex with the double stranded target sequence with G
CC   binding to G-C and T to A-T. The strand runs 3' to 5' in an antiparallel
CC   orientation and when targeted to a specific sequence will deactivate it.
CC   This allows for growth inhibition in cancerous cells; manipulation of
CC   cellular structural protein content; inhibition of IL-2 chain receptor;
CC   disbursing plaque formation in Alzheimer's disease; inhibiting EGF gene;
CC   modulating cholestrol synthesis through the HMGCoA gene; suppressing NGF
CC   gene expression; arresting HSV-I replication and suppressing Beta- globin
CC   expression in thallassaemia and sicle cell anaemia patients. (Updated on

PT   Synthetic oligo-nucleotide(s), prodn. useful e.g. for HIV-1 inhibition -
PT   which bind to target sequence in duplex DNA forming colinear triplex by
PT   binding to major groove.
XX
PS   Example 13; Col 35; 29pp; English.
XX
CC   The beta globin gene encodes on of the proteins comprising human adult
CC   haemoglobin. Mutation in this gene is responsible for beta thalassemia
CC   and sickle cell anaemia. Expression of the gene may be prevented by the
CC   formation of a triplex between the duplex target DNA sequence and an anti
CC   parallel or parallel synthetic oligonucleotide. The triplex
CC   oligonucleotides are designed to inhibit the beta globin gene in
CC   thallassemics and in patients with sickle cell anaemia, to be replaced by
CC   the naturally occurring delta protein. Two classes of triplex
CC   oligonucleotides may be used, targetted against the 5' enhancer or the
CC   promoter/coding domain, in this case from base 874 to 900 (numbering is
CC   relative to the principal mRNA start site). A suitable parallel
CC   oligonucleotide is GL6par (3'-5'). See also AAQ36219-362. (Updated on 25-
CC   MAR-2003 to correct PF field.)

PT   Detecting minority genomes in viral quasi-species, useful for identifying
PT   mutants responsible for drug resistance and to individualize therapy.
XX
PS   Example 1; Page 53; 107pp; Spanish.
XX
CC   The present invention relates to a new method for detecting minority
CC   genomes, present at less than 50%, in a population of nucleic acids of a
CC   viral quasi-species and having at least one mutation with respect to the
CC   majority genome. The invention can be used for genetic diagnosis of viral
CC   infections, especially human immune deficiency virus and hepatitis B or
CC   C, particularly to detect memory minority genomes that are implicated in
CC   failure of antiviral therapy, so the method may make possible design of
CC   therapies customised for individual patients. The present nucleic acid
CC   sequence represents the VFA-MUT-11 DNA sequence that was used in the
CC   methods of the invention

PT   Human tre carcinogenic gene protein 10.56 and encoding polynucleotide,
PT   used in diagnosis and treatment of malignant tumors, hemopathy, human
PT   immunodeficiency virus infection, immunological diseases and
PT   inflammation.
XX
PS   Example 2; Page 17; 36pp; Chinese.
XX
CC   The invention relates to an isolated polypeptide of human tre
CC   carcinogenic gene protein 10.56 comprising a 96 residue amino acid
CC   sequence, fully defined in the specification, or its fragment, analogue
CC   or derivative. The polypeptide is useful in the diagnosis and treatment
CC   of malignant tumours, haemopathy, human immunodeficiency virus (HIV)
CC   infection, immunological diseases and various inflammatory disorders. The
CC   present sequence is a primer used to amplify a polynucleotide encoding
CC   the polypeptide of the invention

CC   Primers for 5'RACE (see AAV27256 and AAV27258), for nested 5'RACE (see
CC   AAV27259), for 3'RACE (see AAV27255) and for nested 3'RACE (see AAV27257)
CC   are based on previously obtained 5' and 3'RACE products of sodium
CC   salicylate-treated sunflower cv. zebulon leaf cDNA (see AAV27252-54).
CC   They were used to obtain further sequence information related to the
CC   novel antifungal protein MS59. 4 Partial cDNA clones were obtained, and
CC   these were used to produce a full-length sequence (see AAV27260) for
CC   sunflower leaf antifungal MS59 protein (see AAW55053). Claimed antifungal
CC   proteins, including MS59, have a mol.wt. of 55-65 kDa (SDS-PAGE), have
CC   carbohydrate oxidase (especially glucose oxidase) activity, show anti-
CC   Phytophthora and/or anti-Pythium activity, can be expressed in transgenic
CC   plants to reduce susceptibility to infection by fungi, or expressed in
CC   host cells for use in antifungal compositions. Plants engineered to
CC   express the antifungal proteins require reduced treatments with
CC   fungicides and have a longer shelf-life

CC   The present invention describes a method for identifying a bacteriophage
CC   coding region encoding a product active on an essential bacterial target.
CC   The method comprises identifying a nucleic acid sequence encoding a gene
CC   product that provides a bacteria-inhibiting function when an
CC   uncharacterised bacteriophage infects a pathogenic bacterium. The
CC   compound active on a target of a bacteriophage inhibitor protein in a
CC   bacteria is used to treat or prevent a bacterial infection in an animal.
CC   AAA68243 to AAA69442 and AAB16523 to AAB16954 represent bacteriophage
CC   nucleotide and protein sequences which are used in the exemplification of
CC   the present invention. (Updated on 06-AUG-2003 to correct OS field.)
CC   (Updated on 15-SEP-2003 to standardise OS field)

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 54; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 108331; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 108332; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the

PT   Rolling circle synthesis of oligo:nucleotide(s) - using primed circular
PT   template to produce oligonucleotide multimer for cleavage.
XX
PS   Example 2; Col 45; 38pp; English.
XX
CC   The present sequence represents an oligonucleotide used in an example of
CC   the present invention. The present invention describes a method for
CC   synthesising a selected oligonucleotide (I) having well defined ends. The
CC   method comprises: (a) annealing a primer to a single-stranded (ss)
CC   circular template to yield a primed circular template, where the template
CC   comprises: (i) at least one nucleotide sequence complementary to (I); and
CC   (ii) at least one nucleotide effective to produce a cleavage site in the
CC   oligonucleotide multimer; (b) combining the primed circular template with
CC   at least two types of nucleotide triphosphates and a polymerase enzyme
CC   without the addition of auxiliary proteins to yield a ss oligonucleotide
CC   multimer complementary to the circular oligonucleotide template,
CC   comprising multiple copies of (I); and (c) cleaving the oligonucleotide
CC   multimer at the cleavage site to produce (I) having well defined ends.
CC   The method is used for the large-scale synthesis of DNA and RNA oligomers
CC   for use, e.g. as probes and diagnostic agents and/or therapeutic agents

CC The circular template was used for the synthesis of the oligomer dT12 in
CC an example of the method of the invention for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template comprising at least one copy of a nucleotide
CC sequence complementary to the sequence of the desired RNA oligonucleotide
CC with at least 2 types of ribonucleotide triphosphate and a polymerase
CC enzyme to yield a single-stranded RNA oligonucleotide multimer
CC complementary to the circular oligonucleotide template, where the RNA
CC oligonucleotide multimer comprises multiple copies of the desired RNA
CC oligonucleotide. The methods can be used for producing RNA
CC oligonucleotides having a specific sequence and well defined ends. The
CC RNA oligonucleotides produced can be used as probes, standards and
CC diagnostic or therapeutic agents. They can be used for modifying the
CC structure or function of a target molecule. They can also be used to
CC cleave disease-associated RNA, DNA or protein

PT New detectably labelled oligonucleotide multimer, comprising multiple
PT contiguous copies of a repeated oligonucleotide - useful for detecting
PT target molecules in diagnosis and medicinal applications.
XX
PS Example 2; Page 41; 103pp; English.
XX
CC The present invention describes a detectably labelled oligonucleotide
CC multimer, comprising multiple contiguous copies of a repeated
CC oligonucleotides. The detectably labelled oligonucleotide multimer is
CC useful for detecting a target molecule. Oligonucleotide multimers may be
CC produced in sufficient quantity to be useful for diagnostic and medical
CC applications. The multimers are useful for affinity labelling of
CC proteins, and for signal amplification in highly sensitive affinity
CC capture and sequence identification applications. The method provides a
CC faster, cheaper and simpler way for large-scale production of DNA and RNA
CC oligomers and multimers. The incorporation of labels enables the
CC oligonucleotide multimers to be useful in diagnostics and medicine. The
CC present sequence represents an oligonucleotide used in an example from
CC the present invention

PT Synthesizing RNA oligonucleotide involves combining single-stranded
PT circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT enzyme to yield desired RNA complementary to circular oligonucleotide
PT template.
XX
PS Example 2; SEQ ID NO 5; 78pp; English.
XX
CC The invention relates to a method for synthesising an RNA
CC oligonucleotide, comprising combining a single-stranded circular
CC oligonucleotide template with at least two types of ribonucleotide
CC triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC oligonucleotide multimer complementary to the circular oligonucleotide
CC template, where the RNA oligonucleotide multimer comprises multiple
CC copies of the desired RNA oligonucleotide. The method is useful for
CC synthesising an RNA oligonucleotide with well-defined ends. The circular
CC oligonucleotide is introduced into the cell using direct injection,
CC electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC cation-mediated delivery. The method is useful for treating bacterial
CC and/or viral infections in mammals, particularly drug resistant
CC infections, and for producing double stranded DNA oligomers. The method
CC is performed in the absence of an oligonucleotide primer, or without the
CC addition of auxiliary proteins. This sequence represents an

```
CC   oligonucleotide used in the method of the invention.

XX
CC   The present sequence for bisulfite GM6 reverse PCR primer is used to
CC   study the methylation state of region 6 in human MINT31/T-type calcium
CC   channel CACNA1G which map to chromosome 17. The methylation state of
CC   specific regions within CpG islands associated with the CACNA1G gene
CC   correlate with several cancerous phenotypes involving various tissue and
CC   cell types. Since aberrant methylation of normally unmethylated CpG
CC   islands is often observed in immortalised and transformed cells, CACNA1G
CC   is implicated in cellular proliferative disorders e.g. leukaemia,
CC   colorectal, lung, breast and other cancers. The nucleic acid coding for
CC   CACNA1G is useful as a marker for screening cancer and age related
CC   diseases. A diagnostic kit containing primers (AAS01574-AAS01623) for
CC   amplification of a CpG-containing nucleic acid, where the primer
CC   hybridises with a target polynucleotide sequence (AAS01627-AAS01676), can
CC   be used for detecting aberrant methylation. The CpG island sequences
CC   (AAS01677-AAS01692) are selected from genes encoding CACNA1G,
CC   apolipoprotein B (APOB), caudal type homeobox transcription factor 2
CC   (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (FBN1), G
CC   protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B';
CC   HSPA6), RasGAP-related protein (IQGAP2), klotho (KL), proteinase-
CC   activated receptor 2 (PAR2), paired-like homeodomain transcription factor

CC   The present sequence for human MINT31/T-type calcium channel CACNA1G
CC   region 6 reverse target sequence is used to study the methylation state
CC   of region 6 in MINT31/CACNA1G which map to chromosome 17. The methylation
CC   state of specific regions within CpG islands associated with the CACNA1G
CC   gene correlate with several cancerous phenotypes involving various tissue
CC   and cell types. Since aberrant methylation of normally unmethylated CpG
CC   islands is often observed in immortalised and transformed cells, CACNA1G
CC   is implicated in cellular proliferative disorders e.g. leukaemia,
CC   colorectal, lung, breast and other cancers. The nucleic acid coding for
CC   CACNA1G is useful as a marker for screening cancer and age related
CC   diseases. A diagnostic kit containing primers (AAS01574-AAS01623) for
CC   amplification of a CpG-containing nucleic acid, where the primer
CC   hybridises with a target polynucleotide sequence (AAS01627-AAS01676), can
CC   be used for detecting aberrant methylation. The CpG island sequences
CC   (AAS01677-AAS01692) are selected from genes encoding CACNA1G,
CC   apolipoprotein B (APOB), caudal type homeobox transcription factor 2
CC   (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1 (FBN1), G
CC   protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6 (HSP70B';
CC   HSPA6), RasGAP-related protein (IQGAP2), klotho (KL), proteinase-
CC   activated receptor 2 (PAR2), paired-like homeodomain transcription factor
CC   2 (PITX2), patched A and B (PTCHA; PTCHB) and syndecan 1 and 4 (SDC1;
CC   SDC4) or a MINT31 sequence

PT   New drug delivery construct comprising a transport and active agent
PT   region, useful for the manufacture of a pharmaceutical composition for
PT   treating nerve injury.
XX
PS   Example 14; Page 86; 188pp; English.
XX
CC   The invention relates to a new drug delivery construct comprises at least
CC   one transport agent region and an active agent region. The transport
CC   agent region is able to facilitate the uptake of the active agent region
CC   into a cell. The active agent region is an active therapeutic agent
CC   region able to facilitate axon growth and an analogue. The drug delivery
CC   construct is useful for suppressing the inhibition of neuronal axon
CC   growth, facilitating axon growth, treating nerve injury, treating
CC   ischaemic damage related to stroke injury. The drug delivery construct
CC   and the drug conjugate are useful for the manufacture of a pharmaceutical
CC   composition for treating nerve injury. The invention is useful in gene
CC   therapy. The present sequence is an oligonucleotide used to clone
CC   C3Basic3 reverse HIV Tat protein

PT   Synthesis of oligo:nucleotide(s) - using a single-stranded circular
PT   oligo:nucleotide template ribonucleotide tri:phosphate(s) and a
PT   polymerase to form multimer(s) which can be cleaved.
XX
PS   Example 2; Page 36; 100pp; English.
XX
CC   The linear multimer was produced by rolling circle synthesis in an
CC   example of the method of the invention for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template comprising at least one copy of a nucleotide
CC   sequence complementary to the sequence of the desired RNA oligonucleotide
CC   with at least 2 types of ribonucleotide triphosphate and a polymerase
CC   enzyme to yield a single-stranded RNA oligonucleotide multimer
CC   complementary to the circular oligonucleotide template, where the RNA
CC   oligonucleotide multimer comprises multiple copies of the desired RNA
CC   oligonucleotide. The methods can be used for producing RNA
CC   oligonucleotides having a specific sequence and well defined ends. The
CC   RNA oligonucleotides produced can be used as probes, standards and
CC   diagnostic or therapeutic agents. They can be used for modifying the
CC   structure or function of a target molecule. They can also be used to
CC   cleave disease-associated RNA, DNA or protein

XX
PT   Synthesizing RNA oligonucleotide involves combining single-stranded
PT   circular oligonucleotide, ribonucleotide triphosphate and polymerase
PT   enzyme to yield desired RNA complementary to circular oligonucleotide
PT   template.
XX
PS   Example 2; SEQ ID NO 6; 78pp; English.
XX
CC   The invention relates to a method for synthesising an RNA
CC   oligonucleotide, comprising combining a single-stranded circular
CC   oligonucleotide template with at least two types of ribonucleotide
CC   triphosphate and a polymerase enzyme to yield a single-stranded RNA
CC   oligonucleotide multimer complementary to the circular oligonucleotide
CC   template, where the RNA oligonucleotide multimer comprises multiple
CC   copies of the desired RNA oligonucleotide. The method is useful for
CC   synthesising an RNA oligonucleotide with well-defined ends. The circular
CC   oligonucleotide is introduced into the cell using direct injection,
CC   electroporation, calcium phosphate treatment, lipid-mediated delivery, or
CC   cation-mediated delivery. The method is useful for treating bacterial
CC   and/or viral infections in mammals, particularly drug resistant
CC   infections, and for producing double stranded DNA oligomers. The method
CC   is performed in the absence of an oligonucleotide primer, or without the
CC   addition of auxiliary proteins. This sequence represents an
CC   oligonucleotide used in the method of the invention.

PT   New altered CD40L promoter for use in the study, diagnosis and treatment
PT   of a variety of inflammatory disorders and autoimmune diseases, such as
PT   rheumatoid arthritis.
XX
PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT   Measurement of nucleic acids, using a nucleic acid probe and analysis of
PT   the obtained data.
XX
PS   Example 5; Page 17; 34pp; Japanese.
XX
CC   This invention relates to a method for measuring nucleic acids using a
CC   nucleic acid probe labelled with a fluorochrome. The nucleic acid probe
CC   decreases the fluorescence of the fluorochrome when hybridised with a
CC   target nucleic acid, the decrease in the fluorescence is measured. The
CC   method can be used for measuring a target nucleic acid

PT   protein kinase genes.
XX
PS   Example 3; SEQ ID NO 163; 164pp; English.
XX
CC   The present invention describes a short interfering nucleic acid (siNA)
CC   that downregulates expression of a mitogen-activated protein kinase
CC   (MAPK) genes by RNA interference. Also described: (1) a method for
CC   modulating expression of MAPK genes in cells, tissue explants or
CC   organisms by introduction of siNA; (2) kits for in vitro or in vivo
CC   delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
CC   vectors that express siNA and cells containing these vectors. MAPK siNAs
CC   have cytostatic, anorectic, antidiabetic, antiinflammatory,
CC   antiasthmatic, immunosuppressive, antibacterial, antirheumatic,
CC   antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK
CC   siNAs can be used to modulate the expression of MAPK genes, in cells,
CC   tissue explants or organisms, e.g. for treating obesity; diabetes types I
CC   and II; a wide range of tumours, and inflammatory diseases (asthma,
CC   septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
CC   disease). They can also be used for drug screening; diagnosis; target
CC   identification and validation; genetic engineering; pharmacogenomics;
CC   studying gene function and gene mapping (e.g. of single-nucleotide
CC   polymorphisms). The present sequence represents a MAPK siNA which is used
CC   in the exemplification of the present invention.

XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT   Composition for treating hormone-regulated cancer, e.g. breast and
PT   prostatic tumors, comprising an antisense oligonucleotide that inhibits
PT   expression of insulin like growth factor binding protein-5 by hormone-
PT   regulated tumor cells.
XX
PS   Disclosure; Page 34; 45pp; English.
XX
CC   This sequence represents an antisense oligonucleotide targeted against
CC   human insulin-like growth factor binding protein-5 (IGFBP-5). The
CC   invention relates to a composition for treatment of hormone-regulated
CC   cancer, comprising an antisense oligonucleotide (such as this sequence)
CC   which inhibits expression of IGFBP-5 by hormone-regulated tumour cells.
CC   The compositions is useful for delaying progression of hormone-regulated
CC   tumour cells such as prostatic cancer cells or breast cancer cells, to an
CC   androgen-independent state, by treating hormone sensitive tumour cells
CC   with the antisense sequence which inhibits expression of IGFBP-5 by the
CC   tumour cells. The composition can also be used for treating a hormone-
CC   responsive cancer in an individual, and administering the composition to
CC   the individual after initiation of hormone-withdrawal to induce apoptotic
CC   cell death of hormone-responsive tumour cells, and therefore delaying the
CC   progression of hormone-responsive cancer cells to a hormone-independent
CC   state in the individual. It can also be used for inhibiting or delaying
CC   metastatic boney progression of an IGF-1 sensitive tumour in a mammal, by
CC   administering the composition to inhibit the expression of IGFBP-5 by the
CC   hormone-responsive cancer cells, and therefore inhibiting or delaying
CC   metastatic boney progression of the tumour

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Claim 15; SEQ ID NO 776; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
```

CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT A process for purification of oligonucleotides using liquid
PT chromatography.
XX
PS Example 1; Page 4; 13pp; Japanese.
XX
CC The present sequence is an oligonucleotide provided in a specification
CC relating to the simplified purification of oligonucleotides by liquid
CC chromatography. The process comprises: (a) pouring oligonucleotides
CC protected with a hydrophobic group and oligonucleotide with no protective
CC group into a liquid chromatography column packed with an acid and alkali
CC resistant packing agent, such as polystyrene resin; (b) pouring a mixed
CC developing solvent composed of a buffer made from a volatile salt and a
CC water soluble organic solvent at a suitable concentration gradient into
CC the column; (c) pouring an acid, particularly 6-16 v/v% acetic acid, into
CC the column to deprotect the oligonucleotides protected with the
CC hydrophobic group; (d) pouring a mixed developing solvent composed of a
CC buffer made from a volatile salt, particularly 0.05-0.5 N aqueous
CC ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water
CC soluble organic solvent at a suitable concentration gradient to elute the
CC deprotected oligonucleotides; and (e) removal of the solvent and the salt
CC from the eluted oligonucleotides

PT Diagnosing hepatitis B virus (HBV) infection stages and determining the
PT risk for hepatocellular carcinoma, comprises identifying full length HBV
PT transcripts and truncated HBV transcripts in a serum sample.
XX
PS Example 1; Page 6; 25pp; English.
XX
CC The invention relates to diagnosis of hepatitis B virus (HBV) infection
CC stages comprising identification of full length HBV transcripts (I) and
CC truncated HBV transcripts (II) in a serum sample, where the ratio of I:II
CC is indicative of a particular infection stage. The method is useful for
CC diagnosing HBV infection stages and determining the risk for developing
CC hepatocellular carcinoma. The present sequence is that of a HBV
CC diagnostic PCR primer, useful for the invention

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 4121; 872pp; English.
XX

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   Determining complementarity of nucleotide fragment for gene analysis, by
PT   comparing flow of electric current from or to electroconductive substrate
PT   through DNA fragment, with reference obtained from its complement.
XX
PS   Example 1; Page 12; 28pp; English.
XX
CC   The present invention provides a method for analysing a nucleic acid
CC   strand to determine the degree of complementarity between two sequences.
CC   This involves the measurement of an electric current along the annealed
CC   strands compared to a standard. This is useful in the analysis of genetic
CC   polymorphisms and variation between genes

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 495; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   Analysis of cDNA and gene expression - by amplification of mRNA followed
PT   by digestion with restriction enzymes.
XX
PS   Disclosure; Page 7; 11pp; Japanese.
XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
```

```
CC   method can be used to analyse gene expression rapidly and easily

PT   Analysis of cDNA and gene expression - by amplification of mRNA followed
PT   by digestion with restriction enzymes.
XX
PS   Disclosure; Page 7; 11pp; Japanese.
XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT   Use of amplification primer-mixture and human papillomavirus genus-
PT   specific hybridization probes, for detecting and genotyping human
PT   papillomavirus in biological samples.
XX
PS   Claim 2; SEQ ID NO 26; 61pp; English.
XX
CC   The present invention describes a method for detecting many human
CC   papillomavirus (HPV) genotypes from biological samples. The method
CC   comprises amplifying and hybridising the extracted nucleic acid molecules
CC   with HPV genus-specific primers and probes designed from HPV genomic
CC   regions. Amplification primer-mixtures, consensus primers, type-specific
CC   primers, hybridisation probes, and reagent kits of the present invention
CC   can be used for detecting and genotyping HPV. The primer mixture is
CC   useful for the amplification of the 3, 4, 6, 7, 9, 10, 11, 12, 13, 14,
CC   16, 18, 20, 24, 26, 28, 29, 30, 31, 32, 33, 34, 35, 36, 39, 39, 40, 41,
CC   42, 44, 45, 51, 52, 53, 54, 55, 56, 58, 49, 60, 61, 66, 67, 68, 72, 74 or
CC   77 genotypes of HPV. The HPV genomic regions are useful for designing HPV
CC   genus-specific and HPV genotype-specific hybridisation probes. The
CC   present sequence is used in the exemplification of the present invention.

PT   Molecular indexing of DNA - using restriction enzymes, PCR amplification
PT   and electrophoresis to analyse DNA fragments.
XX
PS   Claim 3; Page 14; 20pp; English.
XX
CC   AAT33701-T33703 represent amplification primers used in the reverse-
CC   transcription of tissue or cell derived mRNA, in the method of the
CC   invention. The method of the invention is a molecular indexing method,
CC   and comprises digesting the cDNA amplified by these sequences with a
CC   class IIS restriction enzyme. Each resultant cDNA fragment is then
CC   ligated to a biotinylated adaptor (selected from a pool of 64 adaptors
CC   cohesive to all possible overhangs), and digesting the products with two
CC   further class IIS restriction enzymes. These steps are repeated (but the
CC   enzyme used for the first step is different in each) to produce two
CC   further cDNA samples. The ligation samples are then recovered using
CC   streptavidin-coated paramagnetic beads, removing the strand complementary
CC   to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer
CC   (such as this sequence) are then used to amplify the cDNA samples. The
CC   amplified products are separated, and the sizes of the fragments obtained
CC   is recorded. The method can be used for the analysis and diagnosis or
CC   diseases such as cancers or viral infections, for the search and
CC   isolation of the genes of physiologically active substances that are
CC   potential pharmaceuticals, or causative genes of hereditary diseases, as
CC   well as for the isolation of genes for improving agricultural products.
CC   Using this method, it is possible to classify (index) DNA into groups in
CC   a short period of time without duplication

PT   Determination of gene expression levels - using combinations of different
PT   cDNA samples tagged with different PCR adaptors.
XX
PS   Example 2; Page 9; 22pp; English.
XX
CC   The present sequence represents a primer which was used to synthesise
CC   Apolipoprotein cDNA in a RT-PCR reaction. This primer as well as primers
CC   AAV61554 and AAV61556 were added to both mouse liver-derived and mouse
CC   kidney-derived total RNA to generate single-stranded cDNA. These primers
CC   were used in the method of the invention to determine the amount ratio
CC   between a cDNA coding for mouse liver-derived Apolipoprotein and a cDNA
CC   that codes for the mouse kidney-derived Apolipoprotein by using Adaptor-
CC   tagged Competitive PCR (ATAC-PCR). This method allows gene expression to
CC   be quantitatively determined, and because internal standards are not
CC   required to prepare a calibration curve, it is a quicker and less
CC   laborious process

PT   Modified nucleomonomers, used in physiologically stable, non-toxic
PT   oligomers used to inhibit expression of nucleic acids and in gene
PT   regulation, antisense technology and diagnostics.
XX
PS   Disclosure; Page 20; 42pp; English.
XX
CC   The invention provides modified nucleomonomers of specified formula and
CC   their pharmaceutically acceptable salts. The nucleomonomers are used as
CC   monomers in oligomers, which are used in pharmaceutical compositions to
CC   inhibit expression of nucleic acid molecules including DNA and RNA in
CC   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC   infected cells. They are used in oligomers for gene regulation, antisense
CC   technology, diagnostic applications to detect target sequences in
CC   biological samples such as those containing pathogenic bacteria, fungi
CC   and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC   encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC   molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC   interleukins associated with pathological conditions such as inflammatory
CC   conditions, cardiovascular disorders, immune reactions, cancer, viral
CC   infections and bacterial infections (see AAA07786 for details of other
CC   uses for which the oligomers are suitable for). Oligomers comprising the
CC   nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC   target nucleic acid sequences, are physiologically stable, non-toxic and
CC   able to penetrate into cells while maintaining stringent base pair
CC   fidelity for target DNA sequences. The oligomers demonstrate significant
CC   single- or double-stranded target nucleic acid binding activity to form
CC   duplexes, triplexes or other forms of stable association

PT   Human phosphatase 79 and encoded polynucleotide, applicable in diagnosis
PT   and treatment of malignant tumor, hemopathy, HIV infection, immunological
PT   diseases and various inflammation.
XX
PS   Example 3; Page 12; 38pp; Chinese.
XX
CC   The invention relates to human phosphatase 79 (AAB73700), nucleic acids
CC   encoding it (AAH24264), and a method for the recombinant production of
CC   human phosphatase 79. The present invention additionally discloses an
CC   agonist of phosphatase 79 for therapeutic use, and an antibody which
CC   specifically binds to human phosphatase 79. Human phosphatase 79, and
CC   nucleotides which encode it may be used for treating a variety of
CC   diseases, such as malignant tumours, blood diseases, HIV (human
CC   immunodeficiency virus) infection, immune disorders and inflammatory
CC   conditions. The protein may also be used to screen for modulators of its
CC   activity or for peptide fingerprinting identification. The polynucleotide
CC   can be used as a primer for nucleic acid amplification reaction or as a
CC   probe for hybridisation reactions, or in producing gene chips or
CC   microarrays. Sequences AAH24265-AAH24266 represent reverse transcription-
CC   PCR (RT-PCR) primers used in an exemplification of the invention to
CC   isolate human phosphatase 79 cDNA

CC production of amyloid precursor protein 9. The protein has a molecular
CC weight of 9 kD. The present invention additionally discloses an
CC antagonist of amyloid precursor protein 9 for therapeutic use, and an
CC antibody which specifically binds to amyloid precursor protein 9. Amyloid
CC precursor protein 9, and nucleotides which encode it may be used for
CC treating a variety of diseases, such as malignant tumours, blood
CC diseases, HIV (human immunodeficiency virus) infection, immune disorders
CC and inflammatory conditions. The protein may also be used to screen for
CC modulators of its activity or for peptide fingerprinting identification.
CC The polynucleotide can be used as a primer for nucleic acid amplification
CC reactions or as a probe for hybridisation reactions, or in producing gene
CC chips or microarrays. Sequences AAH76997-AAH76998 represent reverse
CC transcription-PCR (RT-PCR) primers used in an exemplification of the
CC invention to isolate human amyloid precursor protein 9 cDNA

PT   of a variety of inflammatory disorders and autoimmune diseases, such as
PT   rheumatoid arthritis.
XX
PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 55; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

PT Novel secretory protein and its salt with e.g. anti-cancer, anti-
PT inflammatory and hematopoietic, effects, applicable as drugs in remedies
PT and preventives to treat diseases like cancer and immune diseases.
XX
PS Example 11; Page 70; 122pp; Japanese.
XX
CC AAC90701 to AAC90715 encode the human secretory proteins given in
CC AAB36661 to AAB36675. The proteins can have cytostatic, anti-
CC inflammatory, haematopoietic, anti-coagulant, immunomodulatory and
CC hepatotropic activities, and can be used as cell migratory agents, cell
CC proliferation- stimulants and cell differentiation-inducers. The proteins
CC are useful in the treatment and prevention of diseases such as cancer,
CC lung function disorder, liver function disorder, gastrointestinal
CC disorder and immune diseases. AAC90716 to AAC90755 represent PCR primers
CC which are used in the exemplification of the present invention

CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT   New altered CD40L promoter for use in the study, diagnosis and treatment
PT   of a variety of inflammatory disorders and autoimmune diseases, such as
PT   rheumatoid arthritis.
XX
PS   Example 1; Fig 3; 90pp; English.
XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
```

```
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PT   Synthetic oligo-nucleotide(s) which bind target duplex DNA - forming co-
PT   linear triplex to control transcription process in gene-specific fashion.
XX
PS   Claim 47; Page 31; 40pp; English.
XX
CC   Sequence forms triplex with the double stranded target sequence with G
CC   binding to G-C and T to A-T. The strand runs 3' to 5' in an antiparallel
CC   orientation and when targeted to a specific sequence will deactivate it.
CC   This allows for growth inhibition in cancerous cells; manipulation of
CC   cellular structural protein content; inhibition of IL-2 chain receptor;
CC   disbursing plaque formation in Alzheimer's disease; inhibiting EGF gene;
CC   modulating cholestrol synthesis through the HMGCoA gene; suppressing NGF
CC   gene expression; arresting HSV-I replication and suppressing Beta- globin
CC   expression in thallassaemia and sicle cell anaemia patients. (Updated on
CC   25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA
CC   field.)

PT   Synthetic oligo-nucleotide(s), prodn. useful e.g. for HIV-1 inhibition -
PT   which bind to target sequence in duplex DNA forming colinear triplex by
PT   binding to major groove.
XX
PS   Example 13; Col 35; 29pp; English.
XX
CC   The beta globin gene encodes on of the proteins comprising human adult
CC   haemoglobin. Mutation in this gene is responsible for beta thalassemia
CC   and sickle cell anaemia. Expression of the gene may be prevented by the
CC   formation of a triplex between the duplex target DNA sequence and an anti
CC   parallel or parallel synthetic oligonucleotide. The triplex
CC   oligonucleotides are designed to inhibit the beta globin gene in
CC   thallassemics and in patients with sickle cell anaemia, to be replaced by
CC   the naturally occurring delta protein. Two classes of triplex
CC   oligonucleotides may be used, targetted against the 5' enhancer or the
CC   promoter/coding domain, in this case from base 874 to 900 (numbering is
CC   relative to the principal mRNA start site). A suitable parallel
CC   oligonucleotide is GL6par (3'-5'). See also AAQ36219-362. (Updated on 25-
CC   MAR-2003 to correct PF field.)

CC   haemoglobin. . Mutation in this gene is responsible for beta thalassemia
CC   and sickle cell anaemia. Expression of the gene may be prevented by the
CC   formation of a triplex between the duplex target DNA sequence and an anti
CC   parallel or parallel synthetic oligonucleotide. The triplex
CC   oligonucleotides are designed to inhibit the beta globin gene in
CC   thallassemics and in patients with sickle cell anaemia, to be replaced by
CC   the naturally occurring delta protein. Two classes of triplex
CC   oligonucleotides may be used, targetted against the 5' enhancer or the
CC   promoter/coding domain, in this case from base 874 to 900 (numbering is
CC   relative to the principal mRNA start site). A suitable antiparallel
CC   oligonucleotide is GL6anti. See also AAQ36219-361. (Updated on 25-MAR-
CC   2003 to correct PF field.)

PT   Method for prodn. of cDNA libraries with anchored ends - useful for
PT   subtractive cloning of sequences of interest.
XX
PS   Claim 1; Page 28; 56pp; English.
XX
CC   The invention provides a PCR-based method for generating a full-length
CC   cDNA library with anchored ends. The method uses lock-docking primers
CC   (AAT70106-11), where one primer, poly TV (V = G,C or A) locks over the
CC   polyA tail of eukaryotic mRNA producing first strand synthesis and a
CC   second primer, polyGH (H = A, C or T) locks onto the polyC tail added by
CC   terminal deoxynucleotidyl transferase (TdT). In the final step, AAT70112-
CC   17 (polyAB and polyCD primers; B = G, T or C; D = G, A or T) are used to
CC   amplify the first strand and produce a cDNA library with anchored ends.
```

CC cDNA libraries produced may be used to identify new (unique) nucleotide
CC sequences from PCSUB (PCR-based cDNA subtractive) libraries. The new
CC method produces discreet sized PCR products which would not necessarily
CC require further subcloning/screening. The method also produces full-
CC length cDNA's obtainable from the libraries as opposed to specific cDNA
CC clones, as produced by previously known methods. Other methods such as
CC PCR and RACE require a knowledge of the target sequence to be amplified,
CC by using the PCSUB method no previous knowledge is necessary

XX
PS Disclosure; Page 15; 104pp; Japanese.
XX
CC The present invention describes a method for judging the genotype of a
CC region around a plant semi-dwarf (sd-1) gene in which polymorphisms are
CC present, by detecting the polymorphisms. Also described: (1) examining
CC semi-dwarf characteristics of a plant using the judgment method with
CC detection of polymorphisms; (2) oligonucleotides for amplifying sd-1 DNA
CC regions, which are primers for judging the genotype of a region around a
CC plant sd-1 gene; (3) reagents for judging the genotype of a region around
CC a plant sd-1 gene containing these oligonucleotides; and (4) reagents for
CC examining the semi-dwarf character of a plant containing the
CC oligonucleotides. The method is for judging the genotype of a region
CC around a plant sd-1 gene, which is applicable in genotyping by (d)CAPS
CC ((derived) cleaved amplified polymorphic sequence) for examination of the
CC semi-dwarf character of rice to identify desirable strains e.g. with high
CC crop yield, pest resistance and resistance to flooded water. The method
CC is easy and quick, in which a seedling is required for studying single
CC nucleotide polymorphisms (SNPs) for genotyping, without needing
CC cultivation of seedling to fully-grown plant for judging heterozygote and
CC distinguishing morphology. The present sequence represents a rice sd-1
CC DNA fragment, which is given in the exemplification of the present
CC invention. Rice sd-1 is located on chromosome 1.

PT Determining the concentration of a target nucleic acid, useful e.g. for
PT detecting genetic mutations, comprises using a fluorescently labeled
PT probe in which emission is reduced by binding to the target nucleic acid.
XX
PS Example 5; Page 21; 55pp; English.
XX
CC The invention relates to the determination of the concentration of a
CC nucleic acid target, using a fluorescently labeled probe which produces
CC reduced fluorescence emission when hybridised to the target nucleic acid.
CC The method comprises measuring the reduction in emission caused by
CC hybridisation. The new method is particularly used to quantify target
CC nucleic acids by a real-time polymerase chain reaction, e.g. for
CC quantifying microbial cells in co-cultures or symbiotic systems, for
CC detecting gene mutations or polymorphisms, and for analysing melting
CC curves of target nucleic acids to determine a Tm value. Methods of the
CC invention allow target nucleic acids to be quantified quickly, easily and
CC accurately. Particularly there is no need to remove unbound probe, and no
CC materials are introduced that inhibit amplification by Taq polymerase (so
CC conventional PCR conditions can be used). The specificity of PCR is kept
CC high (amplification of primer dimers is delayed), and the limit of
CC quantitation is reduced. Complex probes are not needed, and amplification
CC can be monitored in real time. The working graph for data analysis
CC (automatically generated by a computer) has a higher correlation
CC coefficient than conventional graphs so more accurate quantitation is
CC possible. The current sequence represents a synthetic

PT   Determining the concentration of a target nucleic acid, useful e.g. for
PT   detecting genetic mutations, comprises using a fluorescently labeled
PT   probe in which emission is reduced by binding to the target nucleic acid.
XX
PS   Example 5; Page 21; 55pp; English.
XX
CC   The invention relates to the determination of the concentration of a
CC   nucleic acid target, using a fluorescently labeled probe which produces
CC   reduced fluorescence emission when hybridised to the target nucleic acid.
CC   The method comprises measuring the reduction in emission caused by
CC   hybridisation. The new method is particularly used to quantify target
CC   nucleic acids by a real-time polymerase chain reaction, e.g. for
CC   quantifying microbial cells in co-cultures or symbiotic systems, for
CC   detecting gene mutations or polymorphisms, and for analysing melting
CC   curves of target nucleic acids to determine a Tm value. Methods of the
CC   invention allow target nucleic acids to be quantified quickly, easily and
CC   accurately. Particularly there is no need to remove unbound probe, and no
CC   materials are introduced that inhibit amplification by Taq polymerase (so
CC   conventional PCR conditions can be used). The specificity of PCR is kept
CC   high (amplification of primer dimers is delayed), and the limit of
CC   quantitation is reduced. Complex probes are not needed, and amplification
CC   can be monitored in real time. The working graph for data analysis
CC   (automatically generated by a computer) has a higher correlation
CC   coefficient than conventional graphs so more accurate quantitation is
CC   possible. The current sequence represents a synthetic
CC   deoxyribooligonucleotide that was used for investigating the base
CC   selectivity of a target nucleic acid

PT Determining the concentration of a target nucleic acid, useful e.g. for
PT detecting genetic mutations, comprises using a fluorescently labeled
PT probe in which emission is reduced by binding to the target nucleic acid.
XX
PS Example 5; Page 21; 55pp; English.
XX
CC The invention relates to the determination of the concentration of a
CC nucleic acid target, using a fluorescently labeled probe which produces
CC reduced fluorescence emission when hybridised to the target nucleic acid.
CC The method comprises measuring the reduction in emission caused by
CC hybridisation. The new method is particularly used to quantify target
CC nucleic acids by a real-time polymerase chain reaction, e.g. for
CC quantifying microbial cells in co-cultures or symbiotic systems, for
CC detecting gene mutations or polymorphisms, and for analysing melting
CC curves of target nucleic acids to determine a Tm value. Methods of the
CC invention allow target nucleic acids to be quantified quickly, easily and
CC accurately. Particularly there is no need to remove unbound probe, and no
CC materials are introduced that inhibit amplification by Taq polymerase (so
CC conventional PCR conditions can be used). The specificity of PCR is kept

CC high (amplification of primer dimers is delayed), and the limit of
CC quantitation is reduced. Complex probes are not needed, and amplification
CC can be monitored in real time. The working graph for data analysis
CC (automatically generated by a computer) has a higher correlation
CC coefficient than conventional graphs so more accurate quantitation is
CC possible. The current sequence represents a synthetic
CC deoxyribooligonucleotide that was used for investigating the base
CC selectivity of a target nucleic acid

XX
CC   A method has been improved for detecting and characterising mRNA
CC   molecules which includes synthesising a double stranded (ds) cDNA from
CC   isolated mRNA, digesting the ds cDNA with a restriction endonuclease to
CC   produce cDNA fragments in which at least one end of the cDNA fragments
CC   has a sequence capable of hybridising to an adaptor DNA sequence. The
CC   improvement comprises: (a) hybridising adaptor DNA sequences to at least
CC   one end of the cDNA fragments; (b) ligating the adaptor DNA sequences to
CC   the cDNA fragments; (c) amplifying the cDNA fragments having ligated
CC   adaptor DNA sequences by a PCR using primers that hybridise to the ends
CC   of the cDNA fragments, where the primers have at least one nucleotide at
CC   the 3' end that specifically hybridises to a subset of cDNA molecules;
CC   and (d) detecting the presence of the resulting amplified cDNA fragments.
CC   The present sequence represent a template poly-A tail used in the present
CC   specification. The method designate restriction display PCR can be used
CC   for characterising cells based on their mRNA content, for representing
CC   expressed genes, and for discovery of therapeutics that alter cellular
CC   gene expression. The method is also useful for characterising cells of a
CC   variety of types and under a variety of physiological conditions. The
CC   method is also useful for identifying cells or tissue from particular
CC   individuals or species based on the fingerprint obtained from the mRNA
CC   content of isolated cells or tissue and comparing it to cells or tissue
CC   from a known source

PT   Identifying nucleic acid encoding novel sex-linked-tissue-linked
PT   receptors, useful for isolating odorant binding proteins or pesticide
PT   alternatives, by analyzing sequences from a male- and female-specific
PT   nucleic acid library.
XX
PS   Disclosure; Fig 5; 83pp; English.
XX
CC   The present sequence is that of an oligonucleotide used in a method
```

```
CC   designed to rapidly array and normalize a complex cDNA library obtained
CC   from a target species. Clones are arrayed into multi-well plates. Each
CC   well contains 16 oligonucleotides with a 5' polylinker, a poly-T run
CC   capable of binding cDNAs by their poly-A tail and a unique 3' sequence,
CC   which allows an anchored oligonucleotide in each well to selectively
CC   hybridise only to those cDNA clones with a complementary 5' end. The
CC   unique 3' key sequences are designed to give a comprehensive level of
CC   degeneracy since they are diverse and numerous enough to ensure that
CC   every possible cDNA sequence can be bound by an individual, specific
CC   oligonucleotide in a single well. The cDNA library is heated to denature
CC   the clones into single stranded DNA, and an aliquot is added to every
CC   well. The anchored oligonucleotide serves as the 3' primer in PCR, and
CC   the common 5' region present in every cDNA clone serves as the 5' priming
CC   site. Denaturing and washing leave anchored cDNA in each well. The
CC   library is now arrayed and normalised. The method was used to identify
CC   and isolate clones encoding G-protein coupled receptors, especially
CC   odourant receptors, and active effectors involved in the olfactory
CC   pathway of invertebrates and vertebrates, e.g. odourant binding proteins,
CC   or other olfactory or neuronal proteins. The identified receptors and
CC   proteins are useful for identifying compounds that reduce a target
CC   animal's sensitivity to odours, for manufacturing compounds or devices
CC   that mask odours, or trapping invertebrates with odourants.
CC   Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC   with desirable effects on specific species, for the development of pest
CC   monitoring systems or non-toxic, species-specific pesticide alternatives,
CC   for controlling insect feeding and breeding behaviour, detecting the
CC   presence of small air-borne molecules, etc

CC   AAT33701-T33703 represent amplification primers used in the reverse-
CC   transcription of tissue or cell derived mRNA, in the method of the
CC   invention. The method of the invention is a molecular indexing method,
CC   and comprises digesting the cDNA amplified by these sequences with a
CC   class IIS restriction enzyme. Each resultant cDNA fragment is then
CC   ligated to a biotinylated adaptor (selected from a pool of 64 adaptors
CC   cohesive to all possible overhangs), and digesting the products with two
CC   further class IIS restriction enzymes. These steps are repeated (but the
CC   enzyme used for the first step is different in each) to produce two
CC   further cDNA samples. The ligation samples are then recovered using
CC   streptavidin-coated paramagnetic beads, removing the strand complementary
CC   to an adaptor-primer. The adaptor primer and an anchored oligo-dT primer
CC   (such as this sequence) are then used to amplify the cDNA samples. The
CC   amplified products are separated, and the sizes of the fragments obtained
CC   is recorded. The method can be used for the analysis and diagnosis or
CC   diseases such as cancers or viral infections, for the search and
CC   isolation of the genes of physiologically active substances that are
CC   potential pharmaceuticals, or causative genes of hereditary diseases, as
CC   well as for the isolation of genes for improving agricultural products.
CC   Using this method, it is possible to classify (index) DNA into groups in
CC   a short period of time without duplication

PT   Determination of gene expression levels - using combinations of different
```

PT cDNA samples tagged with different PCR adaptors.
XX
PS Example 2; Page 9; 22pp; English.
XX
CC The present sequence represents a primer which was used to synthesise
CC Apolipoprotein cDNA in a RT-PCR reaction. This primer as well as primers
CC AAV61554 and AAV61555 were added to both mouse liver-derived and mouse
CC kidney-derived total RNA to generate single-stranded cDNA. These primers
CC were used in the method of the invention to determine the amount ratio
CC between a cDNA coding for mouse liver-derived Apolipoprotein and a cDNA
CC that codes for the mouse kidney-derived Apolipoprotein by using Adaptor-
CC tagged Competitive PCR (ATAC-PCR). This method allows gene expression to
CC be quantitatively determined, and because internal standards are not
CC required to prepare a calibration curve, it is a quicker and less
CC laborious process

PT Gene detection method involves hybridizing probe opposite to objective
PT gene out of fractional gene cluster.
XX
PS Example 1; Page 9; 11pp; Japanese.
XX
CC The present invention describes a gene detection method which comprises
CC fractionating using a probe opposite to the objective gene which is
CC hybridised out of fractioned gene cluster. The objective gene detected
CC belongs to the group of objective genes contained in the sample. The
CC method is used for gene detection by fractionation of cDNA by molecular
CC index method using specific primer. It provides high detection
CC sensitivity of objective gene. AAA08407 to AAA08414 represent
CC oligonucleotides used in the exemplification of the present invention

PT Mutation analysis of NF1 gene by treating EBV transformed lymphoblastoid
PT cell lines formed with lymphocytes of patient with protein synthesis
PT inhibitor, and obtaining peptides by translating amplified RNA from cell
PT line.
XX
PS Claim 9; Page 60; 102pp; English.
XX
CC The sequences represent neurofibromatosis type 1 (NF1) cDNA fragments and
CC PCR primers and sequencing primers for use in mutation analysis of NF1. A
CC method for mutation analysis of the NF1 gene involves isolating
CC peripheral blood lymphocytes (PBL) of a patient, establishing Epstein-
CC Barr virus (EBV) transformed B-lymphoblastoid cell line with isolated
CC PBL, or short-term culturing of PBL by phytohaemagglutinin (PHA)
CC stimulation, treating the cell line or short-term culture with protein
CC synthesis inhibitor and immediately extracting RNA from the cultures. The
CC RNA is then amplified and peptide fragments are obtained by in vitro
CC transcription/translation of amplified fragments. Mutation analysis of
CC NF1 is used for detection of frame shift, mis-sense and silent mutations
CC in various exons of the gene. This is useful in screening for NF1
CC mutations in young children who are often oligosymptomatic. Efficacy of a
CC drug or agent can be identified by a screening process in which
CC modulation is monitored in vitro using cell systems in which the
CC defective NF1 gene is expressed. The sequences can be used to design
CC drugs which modulate NF1 activity, by using knowledge of the structure of
CC the NF1 protein and of specific defects of the various NF1 mutant
CC proteins. The method allows for reliable analysis of mutations that are
CC difficult to detect due to unstable or wrong-spliced transcripts

CC   The present sequence is that of the 5' end of a cDNA clone isolated from
CC   a mosquito antenna cDNA library. The clone was isolated using a method
CC   designed to rapidly array and normalize a complex cDNA library obtained
CC   from a target species. Clones are arrayed into multi-well plates. Each
CC   well contains 16 oligonucleotides (see ABV74137) with a 5' polylinker, a
CC   poly-T run capable of binding cDNAs by their poly-A tail and a unique 3'
CC   sequence, which allows an anchored oligonucleotide in each well to
CC   selectively hybridise only to those cDNA clones with a complementary 5'
CC   end. The unique 3' key sequences are designed to give a comprehensive
CC   level of degeneracy since they are diverse and numerous enough to ensure
CC   that every possible cDNA sequence can be bound by an individual, specific
CC   oligonucleotide in a single well. The cDNA library is heated to denature
CC   the clones into single stranded DNA, and an aliquot is added to every
CC   well. The anchored oligonucleotide serves as the 3' primer in PCR, and
CC   the common 5' region present in every cDNA clone serves as the 5' priming
CC   site. Denaturing and washing leave anchored cDNA in each well. The
CC   library is now arrayed and normalised. The method was used to identify
CC   and isolate clones encoding G-protein coupled receptors, especially
CC   odourant receptors, and active effectors involved in the olfactory
CC   pathway of invertebrates and vertebrates, e.g. odourant binding proteins,
CC   or other olfactory or neuronal proteins. The identified receptors and
CC   proteins are useful for identifying compounds that reduce a target
CC   animal's sensitivity to odours, for manufacturing compounds or devices
CC   that mask odours, or trapping invertebrates with odourants.
CC   Semiochemicals (e.g. arometics or pheromone mimetics) can be developed
CC   with desirable effects on specific species, for the development of pest
CC   monitoring systems or non-toxic, species-specific pesticide alternatives,
CC   for controlling insect feeding and breeding behaviour, detecting the
CC   presence of small air-borne molecules, etc

PT   Novel human zinc finger protein 27.50.
XX
PS   Example 3; Page 17 (Disclosure); 31pp; Chinese.
XX
CC   The invention relates to a novel human zinc finger protein 27.50, and the
CC   polynucleotide encoding it. The polypeptide is useful for treating
CC   several diseases, such as solid tumour, nervous system disease, malignant
CC   disease of blood, development disturbance and HIV infection. The sequence
CC   represents a PCR primer used in example 3 of the invention

XX
PS   Claim 1; SEQ ID NO 84876; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

PT Amplification primer for animal cytochrome b gene - and determining
PT origin of biological material, esp. of meat prods. used in foods.
XX
PS Claim 7; Col 5; 6pp; German.
XX
CC This oligonucleotide is primer Mt-2. It is used in a claimed method, with
CC primer Mt-11 (AAT61048) to determine the origin of a biological material.
CC The primers amplify the cytochrombe b gene. The method is especially
CC applied to material derived from chicken, poultry, pigs, cattle, sheep,
CC game, fish and seafoods, particularly for control of foods. The origin of
CC the material can be determined reliably and relatively quickly, in an
CC automated procedure capable of examining 100 samples per day. It uses
CC standard methods of genetic engineering, is highly sensitive and
CC universally applicable. Since the primers generate a relatively small
CC amplicon, the method can be used on processed meats where the DNA is
CC likely to be highly fragmented

CC This 5' primer was used with a 3' primer (see AAV07975) in the PCR
CC amplification of Helicobacter pylori strain ORV2001 genomic DNA in order
CC to obtain DNA (see AAV07917) encoding a 76 kDa polypeptide (see AAW73028)
CC designated GHPO 711. The primer pair includes a 5' clamp and BamHI and
CC XhoI restriction enzyme reocgnition sequences for cloning purposes. The
CC PCR product was ligated into vector pET28a, and recombinant polypeptide
CC was expressed as a histidine-tagged fusion protein in E. coli host cells.
CC The polypeptide can be used to develop vaccines for the treatment and
CC prevention of Helicobacter infections. (Updated on 25-MAR-2003 to correct
CC PI field.)

PT Determining if a tissue sample has a chromosome (11:18) translocation
PT associated with malignancies by amplifying a nucleic acid sample using
PT primers complementary to chromosome 11 region q21-22.3 and chromosome 18
PT region q21.1-22.
XX
PS Example 3; Page 22; 47pp; English.
XX
CC The present invention describes a method for determining if a tissue
CC sample comprises a cell with a chromosome (11:18) translocation
CC associated with malignancies such as mucosa-associated lymphoid tissue
CC (MALT) lymphomas. The method comprises subjecting a sample nucleic acid
CC to amplification using primers complementary to sequences which are on
CC chromosome 11 region q21-22.3 and on chromosome 18 region q21.1-22. The
CC method can be used for determining if a tissue sample or analogue
CC comprises a chromosome (11:18) translocation associated with malignancies
CC such as mucosa-associated lymphoid tissue lymphomas. The nucleic acid or
CC the antibody may be used as a probe for detection, for hybridisation to
CC southern blot cell DNAs or for in situ hybridisation of cells, or for
CC determining the presence of complementary DNA. The present sequence
CC represents an intron-exon boundary oligonucleotide from the human MALT-
CC lymphoma associated translocation (MLT) gene, which is used in an example
CC from the present invention

PT   New isolated oxalate decarboxyalse gene - obtained from Aspergillus
PT   phoenices, used for e.g. degrading oxalic acid, protecting against oxalic
PT   toxicity or as a selectable marker in plants.
XX
PS   Example 1; Page 24; 58pp; English.
XX
CC   Sequences AAV65729 to AAV65740 represent primers used for the PCR
CC   amplification of the genomic DNA encoding an Aspergillus phoenices
CC   oxalate decarboxylase (APOXD) enzyme. A vector containing the APOXD
CC   nucleic acid can be used to transform host cells for the recombinant
CC   production of the enzyme. The APOXD can be used for the degradation of
CC   oxalic acid in providing protection against oxalic acid toxicity. It is
CC   useful in combating and providing protection against plant pathogens that
CC   utilise oxalate to gain access to plant tissue or otherwise in the course
CC   of the pathogenesis of the disease. The APOXD gene is also useful as a
CC   selectable marker of transformed cells, for diagnostic assay of oxalate,
CC   and for production of the enzyme in plants. The product can also be used
CC   in diagnostic assays to quantify oxalate, e.g. in the diagnosis and
CC   treatment of patients with urinary tract disorders or hyperoxaluric
CC   syndromes

PT   Newly isolated polynucleotides useful for degrading and detoxifying
PT   fumonisins - and methods for identifying transformed plant cells.
XX
PS   Example 8; Page 37; 88pp; English.
XX
CC   The invention relates to fumonisin esterases from E. spinifera and Gram-
CC   negative bacteria. This enzyme can degrade fumonisin. The polynucleotides
CC   encoding fumonisin degrading enzymes are useful for degrading fumonisins
CC   during the process of harvesting grain for animal feed, or in plant
CC   tissues, which are used for silage or as a spray on grain, fruit or
CC   vegetables. They are also useful for detoxifying fumonisins, structurally
CC   related mycotoxins, and fumonisin hydrolysis products of both. The
CC   fumonisin esterase genes (contained within an expression cassette,
CC   encoding a fumonisin degradative enzyme) is introduced into plant cells
CC   that are cultured on a medium containing a phytohormone linked to a
CC   tricarballylic acid (TCA), which inactivates the phytohormone unless it
CC   is cleaved by an esterase. The polynucleotides are also used in a method
CC   for measuring gene expression, comprising transforming cells with the
CC   esterase genes operably linked to a promoter, adding substrate, and
CC   measuring the level of hydrolysed product. The isolation of the
CC   polynucleotides encoding the fumonisin degrading enzymes permits the
CC   degradation and detoxification of fumonisins, which are toxic and
CC   potentially widespread in food and feed. The present sequence represents
CC   a E. spinifera fumonisin esterase gene specific primer used for the
CC   isolation of a full-length cDNA of ESP26-1

PT   New isolated nucleic acid encoding oxalate decarboxylase from Aspergillus
PT   phoenices, for degrading oxalic acid, identifying transformed plant
PT   cells, and preventing pathogenic disease in plants.
XX
PS   Example 1; Page 28; 60pp; English.
XX
CC   The present sequence is that of a dT-based primer, which was used in a 5'
CC   RACE to obtained a fragment of the Aspergillus phoenices oxalate-
CC   decarboxylase (APOXD) gene. Following 3' and 5' RACE, a full-length
CC   nucleic acid (see ABZ70560) encoding APOXD enzyme (see ABP72475) was
CC   obtained. The APOXD gene and its encoded protein are useful for degrading
CC   oxalate, protecting plants from pathogenic disease, in diagnostic assays
CC   of oxalate, and as a selectable marker

PT   New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated
PT   with tumours or mRNA expressed from gene encoding multiple drug
PT   resistance.
XX
PS   Claim 3; Fig 8; 69pp; English.
XX
CC   The sequences given in AAQ51825-2266 represent areas of mRNAs which are
CC   associated with development or maintenance of chronic myelogenous
CC   leukemia (CML), promyelocytic leukemia, Burkitt's lymphoma, or acute
CC   lymphocytic leukemia, follicular lymphoma, B-cell acute lymphocytic
CC   leukemia, breast cancer, colon carcinoma, neuroblastoma and lung cancer.
CC   The full length mRNAs containing these target sequences, encode aberant
CC   cellular proteins which are able to control cellular proliferation and
CC   are directly linked to a leukemic phenotype. These target sequences are
CC   identified by the ribozyme of the invention. The ribozymes is formed in a
CC   hammerhead motif, but may also be formed in the motif of a hairpin,
CC   hepatitis delta virus, group I intron or RNaseP-like RNA. These ribozymes
CC   may be used to inhibit the development or expression of a transformed
CC   phenotype in man and other animals by modulating expression of the
CC   corresponding gene. Cleavage of target mRNAs expressed in pre-neoplastic
CC   and transformed cells elicits inhibition of the transformed state.
CC   Multiple drug resistance (mdr-1) mRNA specific ribozymes remove the
CC   mechanism of drug resistance used by transformed cells and thus enhances
CC   drug therapies for tumours. The ribozymes may also be used to study
CC   genetic drift and mutations within cells. (Updated on 25-MAR-2003 to
CC   correct PN field.)

PT   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT   stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT   rheumatoid arthritis, etc., in a human patient.
XX
```

```
PS   Claim 4; Page 79; 218pp; English.
XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention

PT   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT   stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT   rheumatoid arthritis, etc., in a human patient.
XX
PS   Claim 4; Page 79; 218pp; English.
XX
CC   The present invention describes nucleic acid molecules which modulate the
CC   synthesis, expression and/or stability of a mRNA encoding 1 or more
CC   receptors of vascular endothelial growth factor (VEGF). A patient
CC   (preferably human) having a condition associated with the level of the
CC   fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC   receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC   angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC   treated by administering the nucleic acid molecule or the expression
CC   vector to the patient. AAX67275 to AAX75752 represent specific examples
CC   of nucleic acid molecules from the present invention

PT   Peptides having at least two new nucleotides - useful as primers in RT-
PT   PCR.
XX
PS   Disclosure; Page 11; 19pp; Japanese.
XX
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT   New nucleic acids that interact, and optionally cleave, target sequences,
PT   used to treat cancer.
XX
PS   Claim 77; Page 79; 148pp; English.
XX
CC   The present invention describes nucleic acids (A) that interact stably
CC   with a target sequence and contain at least one phosphoro(di)thioate
CC   link, having endonuclease activity. (A), and more generally any catalytic
CC   nucleic acid (A') that modulates expression of the oestrogen receptor
CC   gene, are used to treat cancer (particularly of breast or endometrium),
CC   in vivo or by transforming cells ex vivo and implanting treated cells, or
CC   for other conditions associated with levels of oestrogen receptor.
CC   Because of the high selectivity for targeted RNA, (A) can also be used to
CC   correlate inhibition of gene expression with alterations in phenotype,
CC   particularly for identification of therapeutic targets, and as research
CC   reagents (for RNA, in the same way that restriction endonucleases are
CC   used with DNA). The combination of modifications in (A) improves
CC   resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC   AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC   AAA24748 to AAA25992 represent their corresponding target sequences.
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and

PT   Retroviral expression vector, useful in gene therapy, contains a promoter
PT   from a human endogenous retrovirus to provide cell-specific expression.
XX
PS   Disclosure; Page 27; 67pp; German.
XX
CC   This invention describes a novel retroviral expression vector (A)
CC   containing DNA sequences (I) for packaging vector RNA and for cell-
CC   specific expression of proteins or peptides encoding by heterologous DNA
CC   (II). The sequences controlling cell-specific expression contain a cell-
CC   specifically regulatable promoter region (P) from a human endogenous
CC   retrovirus (HERV) DNA sequence. The invention also describes (a) mRNA and
CC   RNA of (A); (b) prokaryotic and eukaryotic cells containing (A); (c)
CC   eukaryotic cells containing (A) in integrated form; (d) virions
CC   containing a retroviral expression vector RNA derived from (A); (e) a
CC   method for producing the virions of (d); (f) a method for incorporating
CC   protein-encoding nucleic acid sequences into a eukaryotic cell by
CC   infection with the virions of (d); and (g) a retroviral vector system
CC   containing (A) and a packaging cell line, that contains at least one
CC   (recombinant) retrovirus construct that encodes for the packaging
CC   proteins of (A). (A) are used for cell- or tissue-specific expression of
CC   foreign genes for gene therapy and to produce virions for introducing
CC   (II) into the chromosomal DNA of eukaryotic cells, preferably mammalian
CC   and specifically human. (A) retain the advantages of usual retroviral
CC   promoters with all the signal structures required for transcription in a
CC   small region within the U3-R segment, but without their disadvantages
CC   (excessive strength and limited cell specificity). Since (A) are derived
CC   from endogenous (harmless) viral sequences, they do not introduce any new
CC   viral sequences into the genome and recombination will not create new
CC   types of retrovirus. The promoters provide cell or tissue specific
CC   expression, according to which HERV they are derived from

PT   Preparation of mixed backbone oligomeric compounds useful as e.g. primers
PT   for diagnostic tests, involves oxidation of H-phosphonate internucleoside
PT   linkages to phosphodiester internucleoside linkages.
XX
PS   Example 12; Page 34; 49pp; English.
XX
CC   The present sequence is that of a phosphorothioate oligonucleotide
CC   containing 20 T nucleobases, each having a 2'-methoxyethoxy group on its
CC   5' ribosyl sugar moiety. It is an example of an oligomeric compound
CC   produced according to the methods of the invention. The invention
CC   provides compounds and methods for the preparation of mixed backbone
CC   oligomeric, or chimeric, compounds having phosphodiester internucleoside
CC   linkages in addition to phosphorothioate and/or phosphoramidate
CC   internucleoside linkages. The methods also include incorporation of
CC   boranophosphate internucleoside linkages. The methods utilise H-
CC   phosphonate intermediates that are coupled together forming contiguous
CC   regions of 1 or more H-phosphonate internucleoside linkages. Each
CC   contiguous region is subsequently oxidized to phosphodiester,
CC   phosphorothioate, phosphoramidate or boranophosphate internucleoside
CC   linkages prior to further elongation. Mixed backbone oligomeric compounds
CC   are prepared in this manner by oxidizing adjacent regions with different
CC   reagents. Oligomeric compounds of the invention are prepared using novel
CC   oxidation steps that oxidize a region of 1 or more H-phosphonate
CC   internucleoside linkages without degrading existing linkages that have
CC   been previously oxidized. The oligonucleotides obtained are useful as
CC   primers in PCR, probes, linkers, gene fragments and for other diagnostic
CC   tests on e.g. biological tissue, fluid, cells etc., as research reagents,
CC   and as antiviral agents

PT   Evaluating a cellular response to an environmental compound, for use in
PT   toxicological analysis, involves determining or comparing the expression
PT   levels of at least one endogenous gene.
XX
PS   Example 3; Page 27; 77pp; English.
XX
CC   The sequence represents a downstream PCR primer used in a DDRT-PCR
CC   experiment (and in cDNA synthesis), demonstrating the method of the
CC   invention. The method relates to evaluating a cellular response to an
CC   environmental compound, comprising determining or comparing the
CC   expression levels of at least one endogenous gene e.g by differential
CC   display of reverse transcribed mRNAs by PCR (DDRT-PCR). The method can be
CC   adapted to identify compounds that act on the level of endogenous gene
CC   expression through activating nuclear receptors. The method is useful in
CC   toxicological analysis, diagnostics, for diagnosing cancer (e.g.
CC   testicular, breast, prostate and endometrium), asthma, hypospadia,
CC   cryptorchism and/or allergy, and for evaluating the efficiency of a
CC   treatment for hormonal deficiency or hormonal replacement therapy, in a
CC   human such as a post-menopausal female. The method is also useful for
CC   identifying environmental chemicals or pharmaceutical compositions that
CC   interact with endocrine systems, and for detecting chemicals that pose a
CC   health threat. Expression levels of endogenous genes are determined
CC   rapidly using a sensitive technique, and the expression of any gene can
CC   be monitored. The assays are far more informative than the currently used
CC   assays, and significantly reduces the number of animals required for the
CC   testing, as it is expected that essentially all the animals in a test
CC   group will respond to the compound

PT   Providing mRNA profile, by generating two independent patterns
PT   characteristic of sample mRNA population, analyzing patterns, comparing
PT   gene expression by cell types under varied conditions, and identifying
PT   genes.
XX
PS   Disclosure; Fig 2; 67pp; English.
XX
CC   The present invention relates to a method for providing a profile of mRNA
CC   molecules present in a sample. The method comprises generating two
CC   independent patterns characteristic of the population of mRNA molecules
CC   expressed in the sample and analysing the patterns using a combinatorial
CC   algorithm, comparing gene expression by different or same cell types
CC   under different conditions, and identifying genes having a role in
CC   various cellular processes. The method is useful for the analysis and
CC   identification of transcribed genes, and fingerprinting. The method can
CC   be used to identify genes which play a role in determining various
CC   cellular processes, including susceptibility to external factors,
CC   development, and disease. The present sequence for a PCR primer is used
CC   in the production of a single pattern characteristic of a sample,
CC   employing a Type IIS restriction enzyme (i.e. FokI) in the methods of the
CC   present invention

PT New zinc finger-containing proteins and nucleic acids, useful in
PT manufacturing a medicament for treating or preventing a disorder
PT associated with decreased or increased expression or activity of MDZ3,
PT MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS Example 8; SEQ ID NO 5257; 103pp; English.
XX
CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX
CC   The invention relates to an acyclic linker-containing oligonucleotide
CC   comprising at least one modified deoxyribonucleotide. Oligonucleotides of
CC   the invention are useful for preventing or decreasing translation,
CC   reverse transcription and/or replication of a target RNA in a system.
CC   They are useful for selectively preventing gene expression in a sequence-
CC   specific manner, for hybridising to complementary RNA such as cellular
CC   mRNA or viral RNA, to hybridise to and induce cleavage of complementary
CC   RNA. They are also useful therapeutically in formulations or medicaments
CC   to prevent or treat a disease characterised by the expression of a
CC   particular target RNA. The invention is used in gene therapy. The present
CC   sequence is an antisense oligo used to elicit human RNase (ribonuclease)
CC   H degradation of target RNA. This sequence is used in the exemplification
CC   of the invention

PT   Determining polyadenylation sites within transcribed gene sequences
PT   present in a sample comprises assigning to gene fragments gene candidates
PT   within a database by comparing signals in the dataset with the database.
XX
PS   Example; Fig 3; 81pp; English.
XX
CC   The invention relates to determining the presence of and/or identifying a
CC   polyadenylation site within a sequence of a transcribed gene or variants
CC   present in a sample. The method involves assigning to gene fragments gene
CC   candidates within a database by comparing signals in the dataset with the
CC   database, the database comprising data representing mRNAs with known
CC   polyA sites and/or 'virtual genes' representing a possible
CC   polyadenylation site within an actual gene. The method is useful for
CC   determining the presence of and/or identifying a polyadenylation site or
CC   alternative polyadenylation sites within a sequence of a transcribed gene
CC   or sequences of transcribed gene variants present or potentially present
CC   in a sample, in identifying gene features, particularly in identifying
CC   differences between sequence variants that occur in a population of
CC   nucleic acid molecules, especially in identifying or discovering polyA
CC   site usage or determining polyA site usage in a nucleic acid sample, and
CC   gene variants arising from alternative polyA sites. The present sequence
CC   represents a double stranded product DNA fragment

PT   Producing a population of double-stranded product DNA molecules, useful
PT   for mRNA profiling, comprises amplification by nested polymerase chain
PT   reaction.
XX
PS   Example; Fig 2; 105pp; English.
XX
CC   The invention relates to producing a population of double-stranded
CC   product DNA molecules comprising amplification by a nested PCR method.
CC   The method is useful in profiling mRNA transcribed in a system under
CC   investigation. The oligonucleotides are used as size standards in
CC   electrophoresis, and as internal controls allowing for calculation of
CC   relative amounts of material present. The present sequence represents a
CC   double stranded product DNA, which aids in outlining an approach to
CC   production of a single pattern characteristic of a sample, employing a
CC   type II restriction enzyme (FokI)

CC   The invention relates to the isolation of 6327 nucleotide sequences,
CC   fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC   sequence having at least 80% identity, after optimal alignment, with the
CC   nucleotides, a sequence that hybridizes under stringent conditions with
CC   the nucleotides, or the complement, or corresponding RNA, of the
CC   nucleotides. The nucleotides are used as probes or primers for detecting,
CC   identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC   sense and antisense sequences, of nucleotides involved in tumour
CC   suppression or reversion, apoptosis and or viral resistance, to produce
CC   recombinant polypeptides, and to prepare transgenic animals, as
CC   experimental models. The nucleotides (also vectors containing them and
CC   cells containing the vectors), the encoded polypeptides and antibodies
CC   (Ab) against the polypeptide are useful for prevention and/or treatment
CC   of viral infections or diseases characterized by development of tumours
CC   or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC   Analysis of the expression of the nucleotides can be used for diagnosis
CC   and/or prognosis of these diseases. The nucleotides and polypeptides can
CC   also be used to screen for their specific interactive molecules,
CC   potentially useful for treating diseases associated with abnormal
CC   expression of the nucleotides.

CC   The present invention describes novel proteins isolated from cDNA clones:
CC   AE648_1i; AE693_1i; AK438_1i; AK609_1i; AM1060_1i; AQ2_1i; K433_1i; or
CC   L256_1i, deposited as ATCC 98237. The present sequence represents the 3'-
CC   portion of AQ2_1i isolated from a human ovary cDNA library. The proteins
CC   from the present invention may be administered in a composition to
CC   prevent, treat or ameliorate a medical condition. The proteins may
CC   exhibit biological activities such as nutritional activity, cytokine and
CC   cell proliferation/differentiation activity, immune stimulating or
CC   suppressing activity, haematopoiesis regulating activity, tissue growth
CC   activity, activin/inhibin activity, chemotactic/chemokinetic activity,
CC   haemostatic and thrombotic activity, receptor/ligand activity, anti-
CC   inflammatory activity, cadherin/tumour invasion suppressor activity,
CC   tumour inhibition activity and other activities. (Updated on 25-MAR-2003
CC   to correct PR field.)

PT   Determining the nucleotide sequence of a nucleic acid analyte - using
PT   electro-spray ionisation.
XX
PS   Example 1; Fig 3A; 25pp; English.
XX
CC   The invention relates to an analytical method for determining the
CC   nucleotide sequence of nucleic acid analytes, including chemically
CC   modified oligonucleotides. This new method utilises electrospray
CC   ionisation-Fourier transform mass spectrometry. The ions are excited by
CC   sustained off-resonance excitation with single shot excitation, and the
CC   target fragmented by collisionally activated dissociation by a neutral
CC   gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation
CC   can be nozzle skimmer dissociation. The method is used in molecular
CC   biology and biomedical applications. The method, utilising electrospray
CC   ionisation-Fourier transform ion cyclotron resonance mass spectrometry,
CC   is extremely rapid and acts directly on the oligonucleotide. The method
CC   is effective for a variety of nucleic acid analytes, particularly
CC   chemically modified oligonucleotides which have not previously been
CC   successfully sequenced. The present sequence represents a
CC   phosphorothioate oligodeoxynucleotide

PT   Determining the nucleotide sequence of a nucleic acid analyte - using
PT   electro-spray ionisation.
XX
PS   Example 1; Fig 3A; 25pp; English.
XX
CC   The invention relates to an analytical method for determining the
CC   nucleotide sequence of nucleic acid analytes, including chemically
CC   modified oligonucleotides. This new method utilises electrospray
CC   ionisation-Fourier transform mass spectrometry. The ions are excited by
CC   sustained off-resonance excitation with single shot excitation, and the
CC   target fragmented by collisionally activated dissociation by a neutral
CC   gas, e.g. carbon dioxide. Alternatively, the excitation and dissociation
CC   can be nozzle skimmer dissociation. The method is used in molecular
CC   biology and biomedical applications. The method, utilising electrospray
CC   ionisation-Fourier transform ion cyclotron resonance mass spectrometry,
CC   is extremely rapid and acts directly on the oligonucleotide. The method
CC   is effective for a variety of nucleic acid analytes, particularly
CC   chemically modified oligonucleotides which have not previously been
CC   successfully sequenced. The present sequence represents a
CC   phosphorothioate oligodeoxynucleotide

PT   Peptides having at least two new nucleotides - useful as primers in RT-
PT   PCR.
XX
PS   Disclosure; Page 11; 19pp; Japanese.
XX
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

XX
PS   Example 3; Fig 1; 29pp; English.
XX
CC   The invention relates to methods and kits for amplification of mRNA using
CC   a primer in PCR that contains an RNA polymerase (RNAP) promoter. The
CC   invention provides methods for amplification and detection of RNA derived
CC   from a population of cells, preferably eukaryotic cells and most
CC   preferably mammalian cells, which methods preserve fidelity with respect
CC   to sequence and transcript representation and additionally enable
CC   amplification of extremely small amounts of mRNA. The method and kit are
CC   useful for amplifying and detecting RNA derived from a population of
CC   cells, especially eukaryotic cells like mammals. The RNAs generated are
CC   useful for profiling gene expression in different populations of cells.
CC   The present sequence is a mRNA fragment used in 3' end PCR/IVT (in vitro

XX
CC   The present invention relates to a method for providing a profile of mRNA
CC   molecules present in a sample. The method comprises generating two
CC   independent patterns characteristic of the population of mRNA molecules
CC   expressed in the sample and analysing the patterns using a combinatorial
CC   algorithm, comparing gene expression by different or same cell types
CC   under different conditions, and identifying genes having a role in
CC   various cellular processes. The method is useful for the analysis and
CC   identification of transcribed genes, and fingerprinting. The method can
CC   be used to identify genes which play a role in determining various
CC   cellular processes, including susceptibility to external factors,
CC   development, and disease. The present sequence for a PCR primer is used
CC   in the production of a single pattern characteristic of a sample,
CC   employing a Type II restriction enzyme (i.e. HaeII) in the methods of the
CC   present invention

PT   Determining polyadenylation sites within transcribed gene sequences
PT   present in a sample comprises assigning to gene fragments gene candidates
PT   within a database by comparing signals in the dataset with the database.
XX
PS   Example; Fig 2; 81pp; English.
XX
CC   The invention relates to determining the presence of and/or identifying a
CC   polyadenylation site within a sequence of a transcribed gene or variants
CC   present in a sample. The method involves assigning to gene fragments gene
CC   candidates within a database by comparing signals in the dataset with the
CC   database, the database comprising data representing mRNAs with known
CC   polyA sites and/or 'virtual genes' representing a possible
CC   polyadenylation site within an actual gene. The method is useful for
```

```
CC   determining the presence of and/or identifying a polyadenylation site or
CC   alternative polyadenylation sites within a sequence of a transcribed gene
CC   or sequences of transcribed gene variants present or potentially present
CC   in a sample, in identifying gene features, particularly in identifying
CC   differences between sequence variants that occur in a population of
CC   nucleic acid molecules, especially in identifying or discovering polyA
CC   site usage or determining polyA site usage in a nucleic acid sample, and
CC   gene variants arising from alternative polyA sites. The present sequence
CC   represents a double stranded product DNA fragment

PT   Producing a population of double-stranded product DNA molecules, useful
PT   for mRNA profiling, comprises amplification by nested polymerase chain
PT   reaction.
XX
PS   Example; Fig 1; 105pp; English.
XX
CC   The invention relates to producing a population of double-stranded
CC   product DNA molecules comprising amplification by a nested PCR method.
CC   The method is useful in profiling mRNA transcribed in a system under
CC   investigation. The oligonucleotides are used as size standards in
CC   electrophoresis, and as internal controls allowing for calculation of
CC   relative amounts of material present. The present sequence represents a
CC   double stranded product DNA, which aids in outlining an approach to
CC   production of a single pattern characteristic of a sample, employing a
CC   type II restriction enzyme (HaeII)

XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 3508; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Pharmaceutical composition for treating ailments associated with impaired
PT   respiration, has oligo(s) antisense to specific gene(s) or its
PT   corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT   ubiquinone.
XX
PS   Disclosure; SEQ ID NO 5138; 872pp; English.
XX
CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
```

```
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.
CC   Note: The sequence data for this patent is not represented in the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequences

PT   Analysis of cDNA and gene expression - by amplification of mRNA followed
PT   by digestion with restriction enzymes.
XX
PS   Disclosure; Page 5; 11pp; Japanese.
XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT   Pharmaceutical composition for treating ailments associated with impaired
```

PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 6900; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

PT   Analysis of cDNA and gene expression - by amplification of mRNA followed
PT   by digestion with restriction enzymes.
XX
PS   Disclosure; Page 9; 11pp; Japanese.
XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
CC   method can be used to analyse gene expression rapidly and easily

PT   Analysis of cDNA and gene expression - by amplification of mRNA followed
PT   by digestion with restriction enzymes.
XX
PS   Disclosure; Page 9; 11pp; Japanese.
XX
CC   A method for the analysis of cDNA comprises (a) preparing an aggregate of
CC   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of
CC   labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798)
CC   and using the aggregate of mRNAs as the template for each reverse
CC   transcription primer; (b) digesting each of the prepared aggregates of
CC   the double-stranded cDNAs with restriction enzyme and; (c)
CC   electrophoresing the digested aggregate of cDNAs in seperate lanes. The
```

```
CC   method can be used to analyse gene expression rapidly and easily

PT   Identifying target genes for allele-specific drugs - used for diagnosis,
PT   prevention and treatment of, e.g. cancers, atherosclerotic plaque,
PT   dysplastic lesions, endometriosis or graft versus host disease.
XX
PS   Disclosure; Fig 7; 605pp; English.
XX
CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT   New achiral linker reagents - useful for incorporation of multiple amino
PT   gps. or reporter gps. into oligo:nucleotide(s).
XX
PS   Disclosure; Page 20; 42pp; English.
XX
CC   Achiral linker reagents have been developed for the incorporation of
CC   multiple amino groups into oligonucleotides. The present sequence
CC   represents a modified oligodeoxyribonucleotide. The achiral linker
CC   reagents can be used for incorporation of multiple primary amino groups
CC   or reporter groups into oligonucleotides. They are compatible with
CC   conventional DNA synthesis following the phosphoramidite methodology, and
CC   can be incorporated in good yields. The linker reagents may be used for
CC   labelling of oligonucleotides. They may also be used for preparation of
CC   oligonucleotides, e.g. for use as hybridisation probes, for use as
CC   primers in the polymerase chain reaction or in nucleic acid sequencing
CC   reactions, for production of affinity matrices for purification of DNA
CC   binding proteins or other biomolecules, for production of affinity
CC   matrices for detection of nucleic acid sequences, for cloning recombinant
CC   DNA or for in-vitro mutagenesis

PT   Novel variants of the human mismatch repair gene, MSH6, useful e.g. for
PT   determining predisposition to cancer and for development of drugs.
XX
PS   Claim 1; Page 4; 14pp; German.
XX
CC   This invention describes a novel method of determining a predisposition
CC   to disease by genotyping a subject's DNA sequence (A) of the human
CC   mismatch repair gene, MSH6 at specified positions and comparing with
CC   reference DNA sequences, optionally taking into account all possible
CC   combinations of variations of the individual mutations, including any
CC   chosen absolute number of variations. (A), and analysis of their
CC   sequences, are useful for the following: (i) determining a predisposition
CC   to disease, especially colorectal, endometrial and ovarian carcinoma and
CC   leukemia; (ii) determining an increased mutation rate (frequency of base
CC   substitutions, insertions and/or deletions) in eukaryotic cells; (iii)
CC   predicting the progression, severity and survival time of patients with
CC   neoplastic disease; (iv) the development of therapeutic and 'life-style'
CC   drugs; (v) predicting individual differences in response to known
CC   chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv);
CC   (vi) optimizing individual treatments and interventions against neoplasia

PT   Novel method of stabilizing duplex formation, or destabilizing non-
PT   specific duplex formation using primer containing modified nucleotide
PT   analogs, useful for preventing mispriming during PCR, RACE, DNA synthesis
PT   or sequencing.
XX
PS   Example 1; Page 25; 46pp; English.
XX
CC   The present invention describes a method for destabilising non-specific
CC   duplex formation, between an oligonucleotide and a target nucleic acid
CC   (NA), comprising incubating the target NA with a modified oligonucleotide
CC   (I) comprising a homopolymeric sequence having a modification which
CC   decreases or abrogates H-bonding between the modified oligonucleotide and
CC   the non-specific target NA. The modified oligonucleotide is used to
CC   improve discrimination between the targeted homopolymeric sequence and a
CC   non-homopolymeric target sequence. It is used to increase the proportion
CC   of full length cDNA clones for a library, to reduce mispriming during
CC   sequencing, 5' or 3' RACE (rapid amplification of cDNA ends) or DNA
CC   synthesis or to generate bona fide genetic markers. The present sequence
CC   represents an oligonucleotide which is used in the exemplification of the
CC   present invention

PT   DNA coding for aromatic acyl transferase - for transforming plants which
PT   produce anthocyanin pigments and thus altering colour tone, e.g. of
PT   flowers.
XX
PS   Example 2; Page 21; 94pp; Japanese.
XX
CC   Vectors containing DNA fragments encoding proteins of plant origin with
CC   aromatic acyl transferase activity may be used to transform plants which
CC   produce anthocyanin pigments. The aromatic acyl transferase acylates the
CC   pigments in the flower resulting in colour tone changes and allowing new
CC   colourations to be produced. Six specific DNA sequences encoding aromatic
CC   acyl transferase from different plants are described in AAT37308-T37313.
CC   This primer was used to reverse transcribe aromatic acyl transferase RNA
CC   to produce a cDNA ready for cloning into expression vectors

PT   Novel nucleic acid molecule encoding amino acid sequence capable of
PT   forming cyclic structure, for generating transgenic plants capable of
PT   producing cyclic knotted protein and resistant to pathogens such as
PT   insects.
XX
PS   Example 10; Fig 1B; 112pp; English.
XX
CC   PCR primers AAF85495-97 were used to amplify a DNA fragment encoding
CC   Kalata B1. Kalata B1 is a macrocyclic peptide with diverse biological
CC   activities. The Kalata B1 polynucleotide represents a nucleic acid
CC   molecule of the invention. The specification describes nucleic acid
CC   molecules which encode an amino acid sequence which is capable of being
CC   cyclised within a cell or a membrane of a cell to form a cyclic backbone.
CC   The amino acid sequence comprises sufficient disulfide bonds to confer a
CC   stabilized folded structure on the three-dimensional structure of the
CC   backbone. The nucleic acid molecules of the invention are useful for
CC   producing transgenic genetically modified food or non-food crop plants,
CC   in particular cotton. The peptides or proteins can be manipulated to
CC   introduce modulating activity, for modulating activity of calcium channel
CC   binding is useful in treatment of pain or stroke and C5a binding activity
CC   useful as an antiinflammatory agent. The nucleic acid molecules are
CC   useful in the generation of molecules having animal or plant therapeutic
CC   properties as well as in a range of diagnostic, industrial and
CC   agricultural including horticultural applications and for protecting
CC   plants such as crop plants from pest and/or pathogen infestation

PT microbial identification.
XX
PS Disclosure; Fig 3; 152pp; Japanese.
XX
CC The present invention relates to nucleic acid probes, which are useful
CC for assaying nucleic acids by hybridising with a target nucleic acid, in
CC which a single-stranded oligonucleotide is labelled with a fluorescent
CC substance and a quencher in a manner that the fluorescence intensity of
CC the hybridisation reaction system is increased after completion of the
CC hybridisation but no stem loop structure is formed. The probes are useful
CC for assaying nucleic acids and their polymorphism and mutation,
CC particularly useful for e.g. analytical applications, disease diagnosis
CC and microbial identification. The present sequence was used to illustrate
CC the invention

XX
CC The present invention relates to novel human nucleic acid sequences (I).
CC The present sequence is one such nucleic acid sequence. Expression of (I)
CC are implicated in tumour suppression or reversion and apoptosis and viral
CC resistance. (I) are useful as probes or primers for detecting,
CC identifying, measuring and/or amplifying nucleic acid sequences, as
CC antisense reagents and for recombinant production of polypeptides. (I),
CC polypeptides (II) encoded by (I), vector containing (I), cells containing
CC these vectors and antibodies (Ab) against (II) are all useful for
CC treatment/prevention of viral, tumour and cell degeneration diseases
CC (especially neurodegeneration, such as Alzheimer's disease and
CC schizophrenia). Analysing the expression of (I) is also useful for
CC diagnosis and/or prognosis of such diseases. Transgenic animals carrying
CC (I) are used for studying the aetiology of these diseases (also immune
CC and inflammatory diseases). Note: In the present specification, SEQ ID 1
CC to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown
CC in the specification

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 39; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
CC   enrichment of even very rare molecules and allowing isolation of proteins
CC   that bind specifically to almost any compound or catalyse almost any
CC   reaction

PT   Isolated nucleic acid comprising a nucleic acid encoding any of C-1027
PT   open reading frames (ORFs) -7 to 42, excluding ORF 9 (cagA), useful for
PT   the production of enediyne C-1027 antitumor antibiotics.
XX
PS   Example 1; Page 41; 160pp; English.
XX
CC   The present sequence is a PCR primer for the dNDP-glucose 4,6-dehydratase
CC   (NGDH) coding sequence, which was used in an assay to determine whether
CC   any of the Streptomyces globisporus enediyne C-1027 gene cluster encodes
CC   an NGDH protein. Enediyne C-1027 is an antibiotic, consisting of an
CC   apoprotein and a non-peptidic chromophore, which acts by damaging DNA.
CC   The sequences within the gene cluster can be used to produce the protein
CC   and to identify antagonists, both of which can be used in the treatment
CC   of cancer. It was shown that the cluster does include a NGDH gene,
CC   designated sgcA

PT   Novel gene cluster derived from Streptomyces galilaeus useful for
PT   obtaining hybrid antibiotics, or to increase yields of anthracycline
PT   metabolites, preferably aclacinomycin or related antibiotics.
```

```
XX
PS   Example 1; Page 10; 50pp; English.
XX
CC   The patent discloses a gene cluster for aclacinomycin biosynthesis being
CC   included in a 7 kilobases XhoI-NotI fragment and a flanked 8.5 kilobases
CC   BglII fragment derived from Streptomyces galilaeus (ATCC 31615). This
CC   gene cluster comprises thirteen genes namely sga1, sga2 (activator), sga3
CC   (dehydratase), sga4 (oxidoreductase), sga5 (dTDP-glucose 4,6-
CC   dehydratase), sga6 (glycosyl transferase; GTF), sga7 (putative
CC   isomerase), sga8 (aklaviketone reductase), sga9 (putative polyketide
CC   assembler), sga10 (putative cyclase), sga11 (aminomethylase), sga12
CC   (glucose-1-phosphate thymidylyl transferase) and sga13
CC   (aminotransferase). Aclacinomycin gene cluster is useful for producing
CC   metabolites, preferably anthracycline metabolites by transferring
CC   aclacinomycin gene cluster into Streptomyces peucetius host. It is useful
CC   for the production of hybrid antibiotics and for increasing the yield of
CC   aclacinomycin. It is also useful for genetic engineering and for
CC   producing anthracycline which is useful as an anticancer agent. The
CC   present sequence is a degenerate reverse PCR primer which is used to
CC   amplify 6345 to 6861 bases of the aclacinomycin biosynthetic gene cluster
CC   (AAD03809), which is internal to the 4, 6-dehydratase gene

PT New foam protein from cereals useful for improving foam formation,
PT stability and half-life in foaming products such as beverages and
PT especially beer.
XX
PS Example 6; Page 22; 82pp; English.
XX
CC The present sequence represents a primer used to reverse transcribe mRNA
CC encoding the barley 17 kDa foam protein. The protein has foam enhancing
CC properties, and belongs to the prolamin storage protein family. It is
CC found in the endosperm tissue of mature cereal grain, and is synthesised
CC during grain development. The 17 kDa foam protein can be added to
CC products, e.g. foaming beverages such as beer, to enhance the foaming
CC quality of the product. The protein can be used to produce improved
CC brewed products. The proteins and polynucleotides are especially useful
CC for improving the formation, stability and half-life of the foam head on
CC beer. The antibodies are useful to detect, measure and purify the
CC proteins in samples such as transgenic cells/plants and foaming products

PT   Retinoid-inducible polynucleotide, designated Tazarotene Induced Gene
PT   (TGI1) - having low basal expression, used in assay systems as an
PT   indicator of retinoid action in psoriatic skin cultures.
XX
PS   Example 4; Page 13; 50pp; English.
XX
CC   A NotI-oligo primer (AAT38116) was used to block the poly(A)+ region of
CC   vector pSPORT-1. cDNA derived from mock-treated and AGN-190168- treated
CC   skin raft cultures was ligated into pSPORT-1 and a cDNA library was
CC   created in bacterial host cells. A subtraction procedure and Southern
CC   hybridisation yielded a cDNA clone (AAT38115), designated TIG1
CC   (tazarotene induced gene 1), that corresponds to mRNA that is strongly
CC   induced upon treatment of skin raft cultures with the retinoic acid
CC   receptor beta/gamma selective antipsoriatic synthetic retinoid AGN-190168

PT Nucleoside derivatives comprising pyrene, anthracene or phenanthrene
PT joined to C-1 atom of ribose or de:oxy:ribose sugar moiety - useful in
PT preparation of fluorescently-labeled DNA.
XX
PS Example 5; Fig 13; 114pp; English.
XX
CC The present sequence represents an unlabeled oligonucleotide. The
CC invention relates to a new nucleoside derivative comprising a pyrene,
CC anthracene or phenanthrene joined to the C-1 atom of a sugar moiety
CC through a carbon-carbon bond in either an alpha or a beta configuration,
CC where the sugar moiety is ribose or deoxyribose. Also claimed is a
CC phosphoramidite derivative of the above nucleoside derivative. The above
CC nucleotide derivatives are useful in preparation of fluorescently-
CC labeled DNA or RNA. These may be used in detection of target nucleic
CC acids through hybridisation. The nucleoside analogues stack neatly into
CC an RNA or DNA helix and do not interfere with binding properties of
CC surrounding complementary bases

PT Normalization of nucleic acid libraries.
XX
PS Example 2; Page 35; 59pp; English.
XX
CC The invention relates to a new method for normalisation of nucleic acid
CC molecules that comprises using haptenylated nucleic acid molecules in
CC subtractive hybridization to remove the more highly abundant molecules.
CC Normalised libraries produced by the method make all of the nucleic acid
CC molecules present in the library available for isolation and subsequent
CC analysis for the study of normal function of individual genes and the
CC genomes. Using the methods, normalised nucleic acid libraries having a
CC maximum variation in abundance of the member NAMs no greater than 2- to
CC 10-fold may be produced. The methods provide normalised libraries which
CC have significantly reduced background

PT Nucleic acids encoding human kinase polypeptides, useful for preventing
PT diagnosing and/or treating e.g. cancer, immune, cardiovascular and
PT neuronal-associated diseases, and microbial infections.
XX
PS Example 2C; Page 298; 433pp; English.
XX
CC AAS06778-AAS06827 represent PCR primers used to amplify human cDNA
CC sequences encoding for novel protein kinases (AAU03501-AAU03557). The
CC novel protein kinases have been identified as members of the tyrosine or
CC serine/threonine kinase (PTK and STK) families. The polynucleotides
CC encoding protein kinases and the polypeptides may be used in the
CC prevention, diagnosis and treatment of diseases associated with
CC inappropriate kinase expression. For example, they may be used to treat
CC cancers (especially cancers of haematopoietic origin), cardiovascular
CC disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes),
CC immune related diseases (e.g. rheumatoid arthritis), neurological
CC disorders (e.g. schizophrenia), neurodegenerative disorders (e.g.
CC Parkinson's disease), inflammatory disorders (e.g. asthma), infectious
CC disease (e.g. HIV) and reproductive disorders (e.g. infertility).
CC Additionally, polynucleotides encoding protein kinases may be used for
CC gene therapy and as DNA probes in diagnostic assays. The protein kinase
CC polypeptides may be used as antigens in the production of antibodies
CC against the protein kinases and in assays to identify modulators of
CC protein kinase expression and activity

XX
CC The present invention relates to a method for stimulating an immune
CC response. The method comprises administering an immunostimulatory nucleic
CC acid to a non-rodent subject in sufficient quantity to stimulate an
CC immune response. The present sequence is one such immunostimulatory
CC nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
CC (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects
CC against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae
CC and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma,
CC haemophilus, campylobacter, clostridium, Escherichia coli and/or
CC staphylococcus), fungal antigens and/or parasitic antigens. The method is
CC also useful for preventing cancer, asthma, infectious disease, allergy or
CC immune deficiency. The present sequence can also be used to redirect a
CC Th2 to a Th1 immune response and to activate immune cells. Note: the
CC present sequence may have a phosphorothioate backbone

PT New genotyping oligonucleotide, useful for detecting the presence,
PT absence or identity of single polynucleotide polymorphism in a nucleic
PT acid sample.
XX
PS Claim 1; Page 64; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

PT   New isolated nucleic acid encoding an isoform of human pregnancy
PT   associated plasma protein E, for preventing or aborting pregnancy.
XX
PS   Example 2; Page 312; 353pp; English.
XX
CC   This invention describes a novel isolated nucleic acid that encodes one
CC   of three new isoforms of human pregnancy associated plasma protein E,
CC   hPAPP-E. The products of the invention have abortive and contraceptive
CC   activity and can be used for gene therapy or in a vaccine. The nucleic
CC   acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC   used in pharmaceutical compositions or vaccines for preventing or
CC   aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC   dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC   the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC   antibodies can be used to assess the expression levels of PAPP-E isoform
CC   proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC   antenatally. This sequence represents an oligomer used in scanning the
CC   human PAPP-E genes described in the disclosure of the invention

PT   New isolated nucleic acid encoding an isoform of human pregnancy
PT   associated plasma protein E, for preventing or aborting pregnancy.
XX
PS   Example 2; Page 245; 353pp; English.
XX
CC   This invention describes a novel isolated nucleic acid that encodes one
CC   of three new isoforms of human pregnancy associated plasma protein E,
CC   hPAPP-E. The products of the invention have abortive and contraceptive
CC   activity and can be used for gene therapy or in a vaccine. The nucleic
CC   acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC   used in pharmaceutical compositions or vaccines for preventing or
CC   aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC   dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC   the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC   antibodies can be used to assess the expression levels of PAPP-E isoform
CC   proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC   antenatally. This sequence represents an oligomer used in scanning the
CC   human PAPP-E genes described in the disclosure of the invention

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5561; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   Use of a bacteria comprising bcsABZc operon in their chromosome and
PT   expressing the adrA gene, for producing cellulose and for screening
PT   inhibitors of bacterial cellulose biosynthesis.
XX
PS   Disclosure; Page 24; 47pp; English.
XX
CC   The specification describes the use of a bacteria selected from
CC   Enterobacteriaceae and Pseudomonads for producing cellulose or for
CC   screening inhibitors of bacterial cellulosebiosynthesis. The bacteria
CC   comprise the bcsABZc (bacterial cellulose synthesis) operon (formerly
CC   yhjONML operon) in their chromosome and express the adrA gene (encoding
CC   putative transmembrane protein). The bacteria are useful for producing
CC   cellulose and for screening inhibitors of bacterial cellulose
CC   biosynthesis. Inverse PCR primers ABV76901-02 were used to identify MudJ-
CC   fusion sequences, in the course of the invention

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 600; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence

XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

XX
CC   The invention describes a method of treating non-allergic inflammatory
CC   disease comprising administering to a subject having or at risk of
CC   developing a non-allergic inflammatory disease an immunostimulatory
CC   nucleic acid for prevention or treatment of the disease. The method is
CC   useful for treating non-allergic inflammatory diseases, such as
CC   psoriasis, eczema, allergic contact dermatitis, latex dermatitis or
CC   inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease.
CC   This sequence represents an immunostimulatory nucleic acid

PT New nucleic acid molecule for use as a marker for screening cancer,
PT comprises the coding region for a T-type calcium channel and regulatory
PT sequences associated with the channel.
XX
PS Claim 20; Page 37; 125pp; English.
XX
CC The present sequence for human T-type calcium channel R6 3'-target
CC sequence (complementary to the 3'-bisulfite PCR primer) is used to study
CC the methylation state of R6 of CACNA1G which maps to chromosome 17. The
CC methylation state of specific regions within CpG islands associated with
CC the CACNA1G gene correlate with several cancerous phenotypes involving
CC various tissue and cell types. Since aberrant methylation of normally
CC unmethylated CpG islands is often observed in immortalised and
CC transformed cells, CACNA1G is implicated in cellular proliferative
CC disorders e.g. leukaemia, colorectal, lung, breast and other cancers. The
CC nucleic acid coding for CACNA1G is useful as a marker for screening
CC cancer and age related diseases. A diagnostic kit containing primers
CC (AAS01574-AAS01623) for amplification of a CpG-containing nucleic acid,
CC where the primer hybridises with a target polynucleotide sequence
CC (AAS01627-AAS01676), can be used for detecting aberrant methylation. The
CC CpG island sequences (AAS01677-AAS01692) are selected from genes encoding
CC CACNA1G, apolipoprotein B (APOB), caudal type homeobox transcription
CC factor 2 (CDX2), epidermal growth factor receptor (EGFR), fibrillin-1
CC (FBN1), G protein-coupled receptor 37 (GPR37), heat shock 70kD protein 6

PT   Determining if a tissue sample has a chromosome (11:18) translocation
PT   associated with malignancies by amplifying a nucleic acid sample using
PT   primers complementary to chromosome 11 region q21-22.3 and chromosome 18
PT   region q21.1-22.
XX
PS   Example 3; Page 22; 47pp; English.
XX
CC   The present invention describes a method for determining if a tissue
CC   sample comprises a cell with a chromosome (11:18) translocation
CC   associated with malignancies such as mucosa-associated lymphoid tissue
CC   (MALT) lymphomas. The method comprises subjecting a sample nucleic acid
CC   to amplification using primers complementary to sequences which are on
CC   chromosome 11 region q21-22.3 and on chromosome 18 region q21.1-22. The
CC   method can be used for determining if a tissue sample or analogue
CC   comprises a chromosome (11:18) translocation associated with malignancies
CC   such as mucosa-associated lymphoid tissue lymphomas. The nucleic acid or
CC   the antibody may be used as a probe for detection, for hybridisation to
CC   southern blot cell DNAs or for in situ hybridisation of cells, or for
CC   determining the presence of complementary DNA. The present sequence
CC   represents an intron-exon boundary oligonucleotide from the human MALT-
CC   lymphoma associated translocation (MLT) gene, which is used in an example
CC   from the present invention

PT Isolation of fibre-specific cotton promoter sequences - using selected
PT DNA probes to screen genomic DNA fragments, for production of cotton
PT fibres with improved characteristics.
XX
PS Example; Col 23; 46pp; English.
XX
CC Cotton fibre cell-specific promoter sequences were isolated by
CC differential screening of a cotton plant cDNA library. Of 4788 clones
CC from a 10 day cell library screened with leaf cDNAs, 800 clones not
CC present in the leaf were isolated. These were screened with cDNAs from
CC ovule, root and flower mRNAs and resulted in 79 clones isolated. PCR
CC analysis was then used to remove cross-hybridising clones. This resulted
CC in the isolation of 18 cDNA clones specifically expressed in cotton fibre
CC cells (AAT30242-4 and AAT30253-67). These cDNAs were then used to screen
CC for homologous genomic sequences (AAT30245-53 and AAT30268) in order to
CC obtain the corresp. promoter sequences. This primer was used to generate
CC the first cDNA strand from mRNA isolated from the cotton fibre cells. The
CC promoters isolated from the fibre cell-specific clones can be used to
CC generate transgenic cotton plants and lines producing fibres having
CC altered quantity and quality. (Updated on 25-MAR-2003 to correct PF
CC field.)

XX
CC   This sequence represents an oligonucleotide used in a novel method for
CC   the direct and complete determination of long DNA sequences of
CC   restriction enzymes from PCR products. The method allows independent
CC   recognition of amplified DNA fragments at both ends and removal of one
CC   primer binding site can be carried out and leads to the following steps:
CC   (1) the resultant cleaved PCR fragment having the one primer binding site
CC   is used as a template for the simultaneous determination of the PCR
CC   fragment and the downstream fragment; (2) the fragments can be used for
CC   the determination of long DNA sequences; (3) the PCR amplification of 2
CC   primers provide replacements of the both ends with different restriction
CC   enzyme fragments; and (4) the above mentioned steps may give polarity of
CC   the fragment at both ends for integration in vectors and may be applied
CC   for preparation of samples

PT   New genotyping oligonucleotide, useful for detecting the presence,
PT   absence or identity of single polynucleotide polymorphism in a nucleic
PT   acid sample.
XX
PS   Claim 1; Page 68; 83pp; English.
XX
CC   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC   primer extension (SNPE) primers, and the sequences of regions flanking
CC   sites of single nucleotide polymorphisms SNPs. The present invention
CC   includes kits for determining the presence or absence of a SNP, using the
CC   oligonucleotides of the invention. The PCR primers are used to amplify a
CC   SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC   The oligonucleotides are useful for genotyping a nucleic acid sample by
CC   performing a single-nucleotide primer extension reaction. The
CC   oligonucleotides are useful for determining the presence, absence or
CC   identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC   assess by association analysis the genotype of an individual or group of
CC   individuals, having a pathological phenotypic trait suspected of being
CC   caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC   agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC   dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC   osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC   traits also include symptoms of or susceptibility to multifactorial
CC   disease of which a component is or may be genetic such as autoimmune
CC   diseases, including, rheumatoid arthritis, multiple sclerosis,
CC   inflammation, cancer, nervous system diseases and infection by pathogenic
CC   microorganism. The method is also useful in forensic investigations and
CC   paternity analysis. The present sequence represents a PCR primer specific
CC   for a human SNP containing DNA sequence

XX
PT   Method for prodn. of cDNA libraries with anchored ends - useful for
PT   subtractive cloning of sequences of interest.
XX
PS   Claim 1; Page 26; 56pp; English.
XX
CC   The invention provides a PCR-based method for generating a full-length
CC   cDNA library with anchored ends. The method uses lock-docking primers
CC   (AAT70106-11), where one primer, poly TV (V = G,C or A) locks over the
CC   polyA tail of eukaryotic mRNA producing first strand synthesis and a
CC   second primer, polyGH (H = A, C or T) locks onto the polyC tail added by
CC   terminal deoxynucleotidyl transferase (TdT). In the final step, AAT70112-
CC   17 (polyAB and polyCD primers; B = G, T or C; D = G, A or T) are used to
CC   amplify the first strand and produce a cDNA library with anchored ends.
CC   cDNA libraries produced may be used to identify new (unique) nucleotide
CC   sequences from PCSUB (PCR-based cDNA subtractive) libraries. The new
CC   method produces discreet sized PCR products which would not necessarily
CC   require further subcloning/screening. The method also produces full-
```

```
CC   length cDNA's obtainable from the libraries as opposed to specific cDNA
CC   clones, as produced by previously known methods. Other methods such as
CC   PCR and RACE require a knowledge of the target sequence to be amplified,
CC   by using the PCSUB method no previous knowledge is necessary

XX
PT   Method for prodn. of cDNA libraries with anchored ends - useful for
PT   subtractive cloning of sequences of interest.
XX
PS   Claim 1; Page 27; 56pp; English.
XX
CC   The invention provides a PCR-based method for generating a full-length
CC   cDNA library with anchored ends. The method uses lock-docking primers
CC   (AAT70106-11), where one primer, poly TV (V = G,C or A) locks over the
CC   polyA tail of eukaryotic mRNA producing first strand synthesis and a
CC   second primer, polyGH (H = A, C or T) locks onto the polyC tail added by
CC   terminal deoxynucleotidyl transferase (TdT). In the final step, AAT70112-
CC   17 (polyAB and polyCD primers; B = G, T or C; D = G, A or T) are used to
CC   amplify the first strand and produce a cDNA library with anchored ends.
CC   cDNA libraries produced may be used to identify new (unique) nucleotide
CC   sequences from PCSUB (PCR-based cDNA subtractive) libraries. The new
CC   method produces discreet sized PCR products which would not necessarily
CC   require further subcloning/screening. The method also produces full-
CC   length cDNA's obtainable from the libraries as opposed to specific cDNA
CC   clones, as produced by previously known methods. Other methods such as
CC   PCR and RACE require a knowledge of the target sequence to be amplified,
CC   by using the PCSUB method no previous knowledge is necessary

PT   Detecting minority genomes in viral quasi-species, useful for identifying
PT   mutants responsible for drug resistance and to individualize therapy.
XX
PS   Example 2; Page 55; 107pp; Spanish.
XX
CC   The present invention relates to a new method for detecting minority
CC   genomes, present at less than 50%, in a population of nucleic acids of a
CC   viral quasi-species and having at least one mutation with respect to the
CC   majority genome. The invention can be used for genetic diagnosis of viral
CC   infections, especially human immune deficiency virus and hepatitis B or
CC   C, particularly to detect memory minority genomes that are implicated in
CC   failure of antiviral therapy, so the method may make possible design of
CC   therapies customised for individual patients. The present nucleic acid
CC   sequence represents the VIH-MUT-12 DNA sequence that was used in the
CC   methods of the invention

PT   New recombinant human neurokinin-receptor - used to identify binding
PT   ligands, antagonists and agonists of the receptor.
XX
PS   Example 1; Page 17; 46pp; English.
XX
CC   Degenerate PCR primers were designed based on the known sequence of rat
CC   NK3R central transmembrane core. The corresponding human cDNA sequence
CC   was obtained by amplification of human brain cDNA. New primers corresp.
CC   to the human sequence were designed and anchored PCR was performed using
CC   the human primer in the core region. A primary PCR was carried out using
CC   primers "not1dt" and "s1068" (AAQ49467 and AAQ49468, respectively) on
CC   template cDNA whose synthesis was initiated by "not1dt". After two
CC   further rounds of PCR using "not1dt", first with "s1106" (AAQ49469) and
CC   then with "s1137" (AAQ49470), a 600bp cDNA fragment which encodes the C-
CC   terminal region of human NK3R and the 3'-UTR was obtained and sequenced.
CC   The N-terminal coding region was similarly obtained. Finally a full-
CC   length cDNA (AAQ49461) was obtained in a single step using primers from
CC   the 5' and 3' untranslated regions. The human NK3R sequence will be
CC   useful for developing novel NK3 agonists and antagonists

XX
CC   The present invention describes an isolated, purified nucleic acid, which
CC   is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having
CC   residues 331-455 of the sequence comprising 455 nucleotides given in
CC   AAF74905 where A in the wild type sequence at position 331 (corresponding
CC   to position -125) is replaced with C. (I) has antiarthritic,
CC   antirheumatic, immunosuppressive and antiinflammatory activities, and can
CC   be used in gene therapy. (I) is useful in the study, diagnosis and
CC   treatment of inflammatory and autoimmune diseases, as well as diseases in
CC   which elevated expression of CD40L is a factor, e.g., rheumatoid
CC   arthritis. The present sequence represents a CD40L poly-A tract sequence
CC   which is used in an example from the present invention

PS Disclosure; SEQ ID NO 8107; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT growth/metastasis and inhibiting growth of neoplastic cells.
XX
PS Claim 4; Page 29; 64pp; English.
XX
CC The present sequence represents a 3'-untranslated region (3'UTR) fragment
CC of ribonucleotide reductase R1. The present invention describes: (1)
CC oligonucleotides (ON) comprising at least 7 consecutive nucleotides (nt)
CC or their analogues of a UTR of a housekeeping gene; (2) antisense ON
CC (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologous
CC to ON, and able to cleave it; (4) DNA sequence encoding ON, OAN and Rb;
CC (5) an antibody (Ab) that binds to ON, OAN and Rb; (6) a nt probe ntP
CC that hybridise to ON, OAN and Rb. ON, AON, Rb and Ab are used to modulate
CC (especially inhibit) growth of tumour cells (especially neoplastic cells)
CC and to reduce their capacity for metastasis. The above may also be used
CC to treat benign proliferative disorders e.g. papillomas, atherosclerosis,
CC angiogenesis and viral infections, e.g. human immunodeficiency virus,
CC hepatitis or herpes. ON may further be used: (i) to identify modulators
CC of tumour growth/metastasis; (ii) to identify compounds (especially
CC potential antitumour agents) that inhibit or enhance interaction between
CC ON and its binding substances; (iii) as probes for detecting related
CC sequences, and (iv) to generate Ab, used for detection and quantification
CC of UTR especially for monitoring progress of cancer therapy. SON inhibit
CC tumorigenicity of neoplastic cells, particularly where these are
CC resistant to hydroxyurea

PT Antisense oligonucleotides to ribonucleotide reductase genes - used to
PT modulate tumour growth and inhibit tumour cell proliferation.
XX
PS Claim 8; Page 49; 79pp; English.
XX
CC AAV22531-89 represent antisense oligonucleotides which are targeted
CC against the mRNA of the R1 subunit sequence of ribonucleotide reductase.
CC Aberrant expression of the R2 gene, which encodes the second subunit of
CC the ribonucleotide reductase gene, can determine the malignant
CC characteristics of cells. Suppression of R2 and R1 gene expression was
CC found to reduce transformed properties of tumour cells. The antisense
CC oligonucleotides can be used for modulating tumour cell growth, or for
CC inhibiting tumour cell proliferation. They can also be used for
CC increasing the sensitivity of neoplastic cells to chemotherapeutic drugs
CC (especially to hydroxyurea, methotrexate (MTX), and PALA). The antisense
CC oligonucleotides may be used to treat proliferative disorders including

```
CC   leukaemias, lymphomas, sarcomas, melanomas, various other forms of
CC   cancer, papillomas, arthrosclerosis, psoriasis, polythemia, mastocytosis,

PT   New isolated vertebrate telomerase genes - used to develop products for
PT   treating cancers or for organ regeneration, nerve cell or brain cell
PT   growth following injury or bone marrow transplantation.
XX
PS   Example 1; Page 42; 134pp; English.
XX
CC   This sequence is a PCR primer for DNA encoding a truncated human
CC   telomerase of the invention. Primers that amplify the telomerase coding
CC   sequence can be used in a method for diagnosing cancer in a patient. The
CC   telomerase can be used for detection, diagnosis and drug screening.
CC   Inhibitors of telomerase activity can be used to treat cancers such as
CC   melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon
CC   carcinomas, leukaemias, lymphomas, osteosarcomas or smooth muscle cell
CC   hyperplasias or skin growths. Enhancers of telomerase may be used to
CC   stimulate stem cell proliferation and differentiation (expansion of
CC   haematopoietic stem cells could be administered in the bone marrow
CC   transplant context). As well, many tissues have stem cells. Proliferation
CC   of these cells may be useful in wound healing, hair growth, treatment of
CC   disease such as Wilm's tumour, organ regeneration or differentiation
CC   after injury or diseases, nerve cell or brain cell growth following
CC   injury

PT   New antisense oligonucleotide, AS-I-618-20, is useful for inhibiting
PT   tumor cell growth.
XX
PS   Example 3; Page 32; 137pp; English.
XX
CC   The present sequence is an antisense oligonucleotide directed against the
CC   mRNA encoding the R1 component of mammalian ribonucleotide reductase.
CC   Ribonucleotide reductase catalyses the conversion of ribonucleotides to
CC   their corresponding deoxyribonucleotides and thus plays an important role
CC   in DNA synthesis and cell proliferation. Regulation of ribonucleotide
CC   reductase is altered in cultured malignant cells and increased levels of
CC   R2 protein and R2 mRNA have been found in pre-malignant and malignant
CC   tissues as compared to normal control tissue samples. The present
CC   antisense sequence is therefore useful for inhibiting tumourigenicity of
CC   neoplastic cells and inhibiting metastasis of tumour cells. It is also
CC   useful for increasing sensitivity of neoplastic cells to chemotherapeutic
CC   drugs, thus allowing chemotherapeutic treatments to be used in patients
CC   who have become resistant or less sensitive to chemotherapy. The sequence
CC   may be RNA or DNA and may comprise a modified backbone and/or nucleotide
CC   analogues

PT   Analyzing target nucleic acid sequences, useful for population genetics,
PT   drug development and diagnosing cancer, comprises hybridizing triple
PT   forming oligonucleotide and probe to target sequence.
XX
PS   Example 2; Page 66; 141pp; English.
XX
CC   The sequence is a polypyrimidine oligonucleotide for binding a second
CC   reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) to
CC   the target SNP used to analyse Factor V Leiden SNP using the method of
CC   the invention. The invention relates to analysing target nucleic acid
CC   sequences comprising restricting isolated DNA, hybridising at least one
CC   triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to
CC   form a protected nucleic acid sequence (PNAS) tail structure, hybridising
CC   the captured structure with a single nucleotide polymorphisms (SNP)
CC   identification probe and determining the SNP score. The methods can be
CC   used for analysing target nucleic acid sequences, especially genomic DNA
CC   sequences, to determine if they contain SNPs or short tandem repeats
CC   (STRs). The methods can be used to detect SNPs for use in population
CC   genetics, drug development, forensics, cancer, genetic disease research,
CC   genomic analysis, diagnostics and therapeutics in humans, plants and
CC   animals

PT   New BAP28 polynucleotides and polypeptides overexpressed in prostate
PT   cancer cells for diagnosing prostate tumors, e.g. by hybridization or
PT   polymerase chain reaction assays.
XX
PS   Example; Page 347; 349pp; English.
XX
CC   The invention is directed to BAP28 polypeptides, BAP28 polynucleotide
CC   sequences and regulatory region located at the 3' and 5' ends of the
CC   BAP28 coding region. The BAP28 polypeptides can be expressed by standard
CC   recombinant methodology. BAP28 polynucleotides and polypeptides have been
CC   found to be over expressed in prostate tumour cells, therefore levels of
CC   BAP28 expression and/or activity may be assayed (e.g. by polymerase chain
CC   reaction (PCR)) to diagnose patient suffering from or susceptible to
CC   prostate cancer. Antibodies specific for the BAP28 polypeptides are
CC   useful as diagnostic reagents. Biallelic markers of the BAP28 gene are
CC   useful in genetic analysis. Sequences AAF83934-963 represent primers for
CC   the BAP28 gene and PCTA-1 gene (the coding strand of PCTA-1 gene is on
CC   the opposite of the coding strand of BAP28)

PT   Probes for detecting target nucleotide sequence in sample, has sequence
PT   that forms hairpin structure having a double-stranded segment and single-
PT   stranded loop collectively forming region complementary to target
PT   sequence.
XX
PS   Example 5; Page 50; 72pp; English.
XX
CC   The present sequence is that of oligonucleotide AGT02023, which contains
CC   a single mismatch with a target DNA oligonucleotide (see ABA91531). It is
CC   one of a set of oligonucleotides (see ABA91532-37) containing
CC   mismatch(es) to the target DNA that were tested in a hybridisation/RNase
CC   H cleavage assay. The results showed that 2 mismatches between the target
CC   and the probe ablated RNase H cleavage. The invention provides probes for
CC   nucleic acid hybridisation. The probes form a hairpin structure
CC   comprising a double-stranded stem and a single-stranded loop, and are
CC   capable of both intramolecular and intermolecular hybridisation. The
CC   double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that
CC   is resistant to RNase H cleavage. When the probe hybridises with a target
CC   DNA, the RNA strand in the DNA:RNA duplex becomes sensitive to RNase H
CC   treatment and can be removed. Arrays and methods for nucleic acid
CC   hybridisation using the probes are provided

PT   Novel antisense compound targeted to nucleic acids encoding human or
PT   mouse CCAAT/enhancer binding protein (C/EBP) beta, useful in vitro for
PT   inhibiting expression of human or mouse C/EBP beta in cells/tissues.
XX
PS   Example 15; Col 42; 69pp; English.
XX
CC   Sequences ABL94252-ABL94476 represent antisense oligonucleotides targeted
CC   to the human or mouse CCAAT/enhancer-binding protein alpha (C/EBP alpha)
CC   gene, which inhibit its expression. The antisense oligonucleotides were
CC   designed to target different regions of the human and/or mouse C/EBP
CC   alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels
CC   by quantitative real-time PCR. The C/EBP family of proteins are a family
CC   of transcription factors which regulate the expression of a wide range of
CC   genes that control normal tissue development, cellular function, cellular
CC   proliferation and functional differentiation. C/EBP beta (also known as
CC   C/EPB2, LAP, TCF5, CRP2, NFIL6, IL6DBP, NF-M, AGP/EBP and Apc/EBP)
CC   primarily regulates hormone responsiveness and oxidative stress responses
CC   and is a mediator of IL-6 (interleukin-6) signalling. C/EBP beta is
CC   thought to be involved in carbohydrate metabolism, immunity, the Th1
CC   response, female fertility and gluconeogenic pathways. C/EBP beta is
CC   expressed in the liver, lung, spleen, kidney, brain, and testis, with the
CC   highest expression found in the lung. It is also expressed at a higher
CC   level in malignant ovarian tissue compared with normal ovarian tissue,
CC   and its expression in pancreas is upregulated in response to chronically
CC   elevated levels of glucose, indicating that it is involved in the
CC   impairment of insulin secretion in type II diabetes. The oligonucleotides
CC   of the invention are useful for diagnosis, prevention and treatment of
CC   conditions associated with C/EBP beta expression, such as cancer
CC   (particularly ovarian cancer), tumour formation, diabetes (particularly
CC   type II diabetes), infection, or inflammation

CC   The invention relates to a novel pharmaceutical composition, which has a
CC   first active agent comprising an oligonucleotide antisense to the
CC   initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC   5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC   junctions of genes encoding a polypeptide associated with lung and/or
CC   nasal airway dysfunction and a second active agent comprising an
CC   antiinflammatory steroid and ubiquinone. A composition of the invention
CC   has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC   immunosuppressive, and cytostatic activity. The composition may have a
CC   use in antisense gene therapy. The composition is useful for treating or
CC   preventing a respiratory, lung or malignant disease or condition, also
CC   for enhancing the prophylactic or therapeutic respiratory effect of an
CC   antiinflammatory steroid in a subject, for reducing or depleting levels
CC   of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC   receptor, producing bronchodilation, increasing levels of ubiquinone or
CC   lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC   lung inflammation, lung allergies, or a respiratory disease or condition.

XX
CC   The sequences given in AAT75909-T76029 are primers which were used in the
CC   amplification, cloning and sequencing of the Dengue-2 viral cDNA's of the
CC   invention. The Dengue 2 viral DNA encodes a polyprotein which comprises
CC   the capsid, prM, M, E, NS1, NS2A, NS2B, NS3, NS4A, NS4B and NS5 proteins.
CC   The quadravalent vaccine of the invention comprises an attenuated Dengue
CC   virus clone, PDK-53, and a chimeric DEN-2/1 virus, a chimeric DEN-2/3
CC   virus, and/or a chimeric DEN-2/4 virus. The new quadravalent vaccines are
CC   used to protect against infection by all four serotypes of dengue virus,
CC   DEN-1, DEN-2, DEN-3 and DEN-4, which can lead to dengue fever or fatal
CC   dengue haemorrhagic fever/dengue shock syndrome (DHF/DSS). Host cells are
CC   used to produce the recombinant protein products of the DNA constructs
CC   which are used in the vaccines

PT testing or phenotypic typing for disease.
XX
PS Claim 15; Page 204; 310pp; English.
XX
CC AAX09121-X10268 are allele-specific oligonucleotide primers used in the
CC isolation of various biallelic polymorphic markers found in the human
CC genome (represented in AAX10269-X12937). These primers can be used in a
CC method for determining polymorphic forms in an individual for use in e.g.
CC forensics, paternity testing or for phenotypic typing for diseases such
CC as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
CC hypercholesterolemia, polycystic kidney disease, hereditary
CC spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
CC haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos
CC syndrome, osteogenesis imperfecta, acute intermittent porphyria,
CC autoimmune diseases, inflammation, cancer, diseases of the nervous
CC system, infection by pathogenic microorganisms, and characteristics such
CC as longevity, appearance (e.g. baldness, obesity), strength, speed,
CC endurance, fertility, and susceptibility or receptivity to particular
CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid
CC segments can also be used to produce medicaments for the treatment or
CC prophylaxis of such diseases

PT dysplastic lesions, endometriosis or graft versus host disease.
XX
PS Disclosure; Fig 7; 605pp; English.
XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a
CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

PT   Testing for the presence of polymorphisms associated with inflammatory
PT   bowel disease, using a hybridization assay.
XX
PS   Claim 1; Page 76; 463pp; English.
XX
CC   The present invention describes a method for detecting the presence of
CC   polymorphisms associated with inflammatory bowel diseases such as
CC   ulcerative colitis and Crohn's disease. The methods can be used to detect
CC   the presence of genetic polymorphisms associated with inflammatory bowel
CC   disease and correlating their occurrence with disease states. They may be
CC   used in this way for phenotypic correlations, forensics, paternity
CC   testing, medicine and genetic analysis. The present sequence is a
CC   polymorphic site described in the exemplification of the invention

PT   Mouse Huntington's Disease gene - useful for generating transgenic mice
PT   as a model of Huntington's Disease.
XX
PS   Disclosure; Page 60; 69pp; English.
XX
CC   This oligonucleotide comprises the 5' acceptor site of intron 1 of the
CC   human Huntington's disease (HD) gene. The splice site sequences for the
CC   first 5 exons of the mouse HD gene (see AAT78974) and the human HD gene
CC   were compared (see AAT78985-T79002). Targeted disruption of the murine HD
CC   gene, e.g. at exon 5, can be used to examine the function of the HD gene
CC   and its role in development. Transgenic mice can be used as models of HD

XX
CC   Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC   primer extension (SNPE) primers, and the sequences of regions flanking
CC   sites of single nucleotide polymorphisms SNPs. The present invention
CC   includes kits for determining the presence or absence of a SNP, using the
CC   oligonucleotides of the invention. The PCR primers are used to amplify a
CC   SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC   The oligonucleotides are useful for genotyping a nucleic acid sample by
CC   performing a single-nucleotide primer extension reaction. The
CC   oligonucleotides are useful for determining the presence, absence or
```

CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a PCR primer specific
CC for a human SNP containing DNA sequence

PT   Identifying intercellular protein factors, e.g. intercellular factors
PT   expressed by fibroblasts that inhibit stem cell differentiation in
PT   culture, by employing a phage display technique using cDNA from the
PT   signaling cells.
XX
PS   Example; Page 9; 19pp; English.
XX
CC   The invention relates to identifying proteins, which function as
CC   intercellular signals between a signaling cell and affected cells. The
CC   method involves (a) inserting a cDNA library from the signaling cell into
CC   a phage; (b) incubating the phage with the affected cells; (c) washing
CC   phage that does not bind to the affected cells; (d) eluting the phage
CC   that does bind to the affected cells; and (e) sequencing the cDNA inserts
CC   in the bound phage to identify sequence information useful for
CC   characterizing a protein made by the signaling cell and recognized by a
CC   receptor in the affected cells. The method is useful for identifying
CC   intercellular protein factors, e.g. intercellular factors expressed by
CC   fibroblasts that act to inhibit the differentiation of stem cells in
CC   culture. The present sequence represents a PCR primer used for detecting
CC   T7 phage gene 10 inserts

PT   Novel isolated nucleic acid molecule comprising single nucleotide
PT   polymorphism associated with fish, useful for forming PCR primers which
PT   are used for detecting single nucleotide polymorphisms in fish nucleic
PT   acids.
XX
PS   Claim 1; SEQ ID NO 4; 233pp; English.
XX
CC   The present invention describes an isolated nucleic acid (I) comprising a
CC   single nucleotide polymorphism (SNP) chosen from: (i) a nucleic acid of
CC   Salmo salar SNPs, Oreochromis niloticus SNPs or Atlantic halibut SNPs;
CC   and (ii) a nucleic acid having nucleotide sequence that hybridises to
CC   (i), or its complement under highly stringent hybridisation conditions.
CC   Also described: (1) an isolated oligonucleotide (II) comprising at least
CC   17 contiguous nucleotides of a nucleotide sequence of S. salar SNPs, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites, or their complement; (2)
CC   a primer pair (III) suitable for use in PCR, comprising two (II) capable
CC   of amplifying a nucleotide sequence chosen from S. salar SNPs and, O.
CC   niloticus SNPs, O. niloticus microsatellites, Atlantic halibut SNPs, cod
CC   polymorphic sites and seabass polymorphic sites; and determining (M1) the
CC   origin of fish sample comprising providing a parentage genotype database
CC   comprising a collection of candidate parent genotypes, where each of the
CC   candidate parent genotype represents a distinct origin, and comparing a
CC   sample genotype to the parentage genotype database, where a match between
CC   the sample genotype and one of the candidate parent genotype identifies
CC   to the origin of the sample. (M1) is useful for determining the origin of
CC   a fish sample such as family salmonidae, S. salar, Tilapia, O. niloticus,
CC   rainbow trout, halibut, seabass and Atlantic cod. (II) is useful for
CC   detecting nucleic acid molecule comprising SNP in a sample, which
CC   involves contacting the sample containing nucleic acids with one or more
CC   (II) derived from nucleotide sequence of S. salar SNPs and O. niloticus
CC   SNPs, and identifying nucleic acid that hybridises to (II). (II) is
CC   useful for detecting nucleic acid molecule comprising a polymorphic
CC   sequence in a sample, comprising contacting the sample containing nucleic
CC   acids with one or more (II) which is derived from O. niloticus
CC   microsatellite, O. niloticus SNPs, Atlantic halibut SNPs, cod polymorphic
CC   sites or seabass polymorphic sites, and identifying a nucleic acid that
```

```
CC   hybridises to (II). (III) is useful for detecting nucleic acid molecule
CC   comprising a microsatellite sequence in sample. The present sequence is
CC   used in the exemplification of the present invention.

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5560; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   Novel gene encoding a serine protease and its protein used to screen for
PT   serine protease inhibitors and to prepare lung disease animal models.
XX
PS   Disclosure; Page 7-8; 17pp; Japanese.
XX
CC   Nucleotide sequence AAC66182 encodes human trypsin hL AAB35701, a serine
CC   protease. The invention relates to the human hL gene and protein
CC   sequences, to a recombinant vector containing the nucleotide sequence,
CC   and a host cell containing the vector. Human trypsin hL can be used for
CC   screening for serine protease inhibitors, in the preparation of a lung
CC   disease model animal, and for the development of an index marker of lung
CC   diseases caused by an anti-trypsin hL antibody. The present sequence
CC   represents a PCR primer used in the identification of trypsin hL

XX
PT   New isolated nucleic acid encoding an isoform of human pregnancy
PT   associated plasma protein E, for preventing or aborting pregnancy.
XX
PS   Example 2; Page 311; 353pp; English.
XX
CC   This invention describes a novel isolated nucleic acid that encodes one
CC   of three new isoforms of human pregnancy associated plasma protein E,
CC   hPAPP-E. The products of the invention have abortive and contraceptive
CC   activity and can be used for gene therapy or in a vaccine. The nucleic
CC   acid, polypeptide encoded by it, or antibody to the polypeptide can be
CC   used in pharmaceutical compositions or vaccines for preventing or
CC   aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
CC   dysgenetic pregnancies. The nucleic acids are used as probes to assess
CC   the level of PAPP-E isoform mRNA in chorionic villus samples, and the
CC   antibodies can be used to assess the expression levels of PAPP-E isoform
CC   proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
CC   antenatally. This sequence represents an oligomer used in scanning the
CC   human PAPP-E genes described in the disclosure of the invention

PT   New GPCR-A-1 nucleic acid and polypeptide, useful for diagnosing,
PT   investigating and/or treating disorders associated with aberrant
PT   expression or activity of GPCR-A-1, such as tumors and cancers.
XX
PS   Example 2; SEQ ID NO 626; 156pp; English.
XX
CC   The invention describes an isolated nucleic acid encoding a G protein
CC   coupled receptor (GPCR), mutations of which cause cancer, comprising a
CC   2225 or 1921 base pair sequence, or their degenerate variants, encoding a
CC   409 residue amino acid sequence, all given in the specification, with or
CC   without conservative amino acid substitutions, or complements of the
CC   sequence of them. The encoding nucleic acid is not more than 100 kbase in
CC   length. The methods and compositions of the present invention are useful
CC   for diagnosing, investigating and/or treating disorders associated with
CC   aberrant expression or activity of GPCR-A-1, such as tumours and cancers.
CC   This sequence represents an oligonucleotide used to analyse the gene
CC   encoding human G-protein coupled receptor GPCR-A-1

PT   New GPCR-A-1 nucleic acid and polypeptide, useful for diagnosing,
PT   investigating and/or treating disorders associated with aberrant
PT   expression or activity of GPCR-A-1, such as tumors and cancers.
XX
PS   Example 2; SEQ ID NO 632; 156pp; English.
XX
CC   The invention describes an isolated nucleic acid encoding a G protein
CC   coupled receptor (GPCR), mutations of which cause cancer, comprising a
CC   2225 or 1921 base pair sequence, or their degenerate variants, encoding a
CC   409 residue amino acid sequence, all given in the specification, with or
CC   without conservative amino acid substitutions, or complements of the
CC   sequence of them. The encoding nucleic acid is not more than 100 kbase in
CC   length. The methods and compositions of the present invention are useful
CC   for diagnosing, investigating and/or treating disorders associated with
CC   aberrant expression or activity of GPCR-A-1, such as tumours and cancers.
CC   This sequence represents an oligonucleotide used to analyse the gene
CC   encoding human G-protein coupled receptor GPCR-A-1

PS Disclosure; Page 20; 42pp; English.
XX
CC The invention provides modified nucleomonomers of specified formula and
CC their pharmaceutically acceptable salts. The nucleomonomers are used as
CC monomers in oligomers, which are used in pharmaceutical compositions to
CC inhibit expression of nucleic acid molecules including DNA and RNA in
CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association

PT   New compositions comprising sensor arrays made up of unique probe
PT   oligonucleotides - useful for characterizing a sample of target deletion
PT   oligonucleotides.
XX
PS   Example 9; Page 99; 163pp; English.
XX
CC   This invention describes a novel composition comprising a number of
CC   sensor arrays, where each array comprises a unique probe oligonucleotide,
CC   which is the reverse complement of part of a unique target
CC   oligonucleotide present in a mixture of target deletion sequence
CC   oligonucleotides. The compositions form a method for characterizing a
CC   sample of target deletion oligonucleotides which are labelled and
CC   hybridize with the probe oligonucleotides of the sensor arrays. Such
CC   oligonucleotides and their targets are represented in AAX23548-X23709.
CC   Oligonucleotides characterized by the method form pharmaceutical
CC   compositions that are useful for modulating cellular adhesion or
CC   proliferation, and being active against a eukaryotic pathogen, a human
CC   retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC   retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC   Syncytial Virus or cytomegalovirus (CMV). The compositions enable
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   Isolating particular double stranded DNA - by formation of a triple helix
PT   and sepn. using a specific molecular recognition system and a solid
PT   carrier.
XX
PS   Claim 8; Col 21; 20pp; English.
XX
CC   The oligonucleotides AAT03687-9 are examples of probes used in a novel
CC   DNA purification method designated triplex-affinity capture. The method
CC   comprises binding an oligonucleotide probe to a double-stranded target
CC   nucleic acid under conditions where a triple helix is formed. The probe
CC   is attached directly or indirectly to the one half of a specific binding
CC   pair e.g. biotin/avidin, antigen/antibody. The other half of the binding
CC   pair is attached to an immobilising agent e.g. a bead. After formation of
CC   the target-probe-binding pair-solid support complex, the target mol. can
CC   be recovered by separating the complex from the medium and separating the
CC   probe from the target nucleic acid. The method can be used to isolate
CC   very large specific intact double strand DNA from a heterogenous mix.
CC   This primer was used in conjunction with a S.cerevisiae strain contg. a
CC   triple helix sequence integrated into the LEU2 locus. Genomic DNA from
CC   the strain was cloned into the plasmid pTZ19RG, a derivative of pTZ19R
CC   contg. rare restriction endonuclease sites

PT New human nucleic acid from the SPG4 gene, useful e.g. for diagnosis of
PT autosomal dominant familial spastic paraplegia and in drug screening.
XX
PS Claim 6; Page 30; 145pp; French.
XX
CC AAF84871-AAF84902 represent the acceptor and donor sites of the
CC intron/exon and exon/intron borders of the human SPG4 gene. The SPG4 gene
CC encodes a spastin polypeptide. The sequences may be used as PCR primers
CC and probes. Mutations in the SPG4 gene are responsible for autosomal
CC dominant familial spastic paraplegia. SPG4 polynucleotides, and their
CC fragments, are used to screen DNA banks for sequences that encode spastin
CC (particularly sequences in other mammals, specifically mice); to identify
CC SPG4 mutations, or other genetic anomalies, particularly for diagnosis of
CC autosomal dominant familial spastic paraplegia (PSF-AD); to identify
CC promoters and other regulatory elements of the SPG4 gene; for detection
CC and amplification; for recombinant production of spastin; and for
CC diagnostic genotyping of PSF-AD

CC   The invention relates to human epidermal growth factor (EGF) receptor
CC   protein 10.12 (ABB99979) and nucleic acids encoding it (ABV76656). The
CC   protein has a molecular weight of 10.12 kD. The invention also relates to
CC   a method for the recombinant production of the protein, an antagonist of
CC   the protein, and the use of the protein, gene and antagonist in
CC   therapeutic applications. EGF receptor protein 10.12 can be used in the
CC   treatment of a variety of diseases such as malignant tumours, blood
CC   diseases, HIV (human immunodeficiency virus) infection, immune disorders
CC   and inflammatory conditions. Sequences ABV76657-ABV76658 represent
CC   reverse transcription-PCR (RT-PCR) primers used in an exemplification of
CC   the invention to isolate human EGF receptor protein 10.12 cDNA

PT   Human proliferating cell nuclear antigen 13 and encoded polynucleotide,
PT   used in diagnosis and treatment of malignant tumors, hemopathy, human
PT   immunodeficiency virus infection, immunological diseases and
PT   inflammation.
XX
PS   Example 3; Page 12; 35pp; Chinese.
XX
CC   The invention relates to an isolated polypeptide of human proliferating
CC   cell nuclear antigen (PCNA) 13. This polypeptide and its related
CC   polynucleotide are applicable in diagnosis and treatment of tumours,
CC   transfusion reaction, haemopathy, graft immune rejection, development
CC   disease, hereditary disease, HIV infection and inflammation. Regulators
CC   of the polypeptide activity or expression that can mimic, promote,
CC   antagonise or inhibit human PCNA 13 can be used for this purpose, and
CC   also an antibody that binds specifically to the polypeptide. A method for
CC   detecting diseases or disease susceptibility relating to the polypeptide
CC   involves measuring the expression dose of the polypeptide, determining
CC   the polypeptide activity, or detecting the polypeptide expression dose
CC   caused by the polynucleotide that has abnormal activity due to a
CC   polynucleotide mutation. The polynucleotide can be used to supply primers
CC   for nucleic acid amplification and probes for hybridisation reactions, or
CC   in producing gene chips or microarrays. This sequence represents a
CC   reverse-transcription PCR (RT-PCR) primer used for isolation of cDNA
CC   encoding human PCNA 13

XX
CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PS   Example 4; Col 21; 39pp; English.
XX
CC   The invention relates to an expression vector containing a retron for
CC   msDNA (branched RNA-linked multicopy single-stranded DNA structure)
CC   synthesis. The retron is a genetic element that contains msr and msd
CC   coding regions of the msDNA and a gene encoding a reverse transcriptase,
CC   where msd is a gene coding for the DNA portion of a msDNA molecule and
CC   msr is a gene coding the RNA portion of a msDNA molecule. The msDNA
CC   hybrid molecule comprises a branched single-stranded RNA portion that
CC   is:(a) covalently linked to a single-stranded DNA portion by a 2',5-
CC   phosphodiester bond between the 2'-OH group of an internal rG residue and
CC   the 5'-phosphate of the DNA portion and (b) noncovalently linked to the
CC   DNA portion by base pairing between complementary 3' ends of the RNA and
CC   DNA portions, where the msDNA contains a stable stem-loop structure in
CC   the RNA and/or DNA portion and contains a foreign nucleic acid fragment.
CC   msDNA molecules containing antisense DNA can be used to inhibit or alter
```

PT   Diagnosing human autoimmune disease by detecting retrovirus with
PT   superantigen activity - new retrovirus associated with type 1 diabetes,
PT   its proviral DNA, and related vectors, transformed cells, proteins,
PT   antibodies and specific binding agents, used for treating or preventing
PT   autoimmune disease.
XX
PS   Example; Page 34; 92pp; English.
XX
CC   The sequence is that of an insulin-dependent diabetes mellitus associated
CC   human endogenous retrovirus (IDDMK1.2-22) PCR primer. The retrovirus has
CC   Superantigen (SAg) activity. It can be used as part of a method is
CC   specifically used to diagnose type 1 diabetes mellitus. Modified proteins
CC   expressed by the retroviral sequence (without SAg activity but still able
CC   to induce an immune response) are useful in vaccines to treat or prevent
CC   SAg-related autoimmune disease; nucleic acid sequences encoding
CC   (modified) SAg can be used similarly to treat such diseases. Retroviral-
CC   encoded SAg are important in pathogenesis of autoimmune disease, probably
CC   by activating autoreactive T cells. The method is very specific (it can
CC   differentiate between expressed and non-expressed viral nucleic acids)
CC   and can be used even where the pathogen is an ubiquitous endogenous
CC   retrovirus. Blood or plasma samples can be tested without extensive
CC   preparation and diagnosis can be made before clinical signs are apparent,
CC   allowing early intervention before severe tissue damage has occurred

PT   Method for distinguishing foetal cells from adult cells in blood - based
PT   on amplification and detection of mRNA selectively expressed in foetal
PT   cells.
XX
PS   Example 4, 14; Col 49; 49pp; English.
XX
CC   The invention relates to a method of enriching foetal cells from maternal
CC   blood and for identifying such foetal cells. Foetal cells can be
CC   distinguished from adult cells in a blood specimen by (a) treating a
CC   blood specimen from a pregnant female to yield a mixture of cells
CC   comprising foetal cells and adult cells; (b) amplifying one or more mRNAs
CC   within the cells, the mRNAs being selectively expressed in target foetal
CC   cells to be distinguished but not expressed in adult blood cells; (c)
CC   performing in situ hybridisation on the cells under hybridising
CC   conditions suitable to maintain cell membranes in a substantially intact
CC   state and with a hybridisation medium comprising a detectably labelled
CC   probe complementary to the amplified mRNA that is selectively expressed
CC   in the target foetal cells but not expressed in adult blood cells; (d)
CC   removing the hybridisation medium and unhybridised probe from the mixture
CC   of cells to yield hybridised cells, and (e) detecting the labelled probe
CC   remaining in the hybridised cells; whereby cells in which the labelled
CC   probe is detected are identified as the target foetal cells; A second
CC   method for determining the presence of a target nucleotide sequence in
CC   individual foetal cells present in a cellular specimen is also provided.
CC   The methods (especially the second) is useful for detecting HIV,
CC   hepatitis viruses or herpes viruses in foetal cells, or for detecting
CC   chromosomal abnormalities in foetal cells. The present sequence
CC   represents a probe used for the detection of the Fragile X chromosome in
CC   amniocytes and in peripheral blood mononuclear cells

XX
PS   Claim 8; Page 90; 165pp; English.
XX
CC   This oligonucleotide is specific to the polyA signal present in the 3' R-
CC   poly(A) sequences at the 3' extremity of IDDMK1.2-22, a newly identified
CC   human endogenous retrovirus (HERV) that is the source of superantigen
CC   (SAg) activity in insulin-dependent diabetes mellitus (IDDM) patients. It
CC   can be used as a probe or primer (claimed) in a method for the diagnosis
CC   of a human autoimmune disease. IDDMK1.2-22 is ubiquitous in the human
CC   genome but is only expressed in diabetic individuals. The invention
CC   provides IDDMK1.2-22 nucleic acids (see AAX07186-91) and encoded
CC   polypeptides (see AAW97745-48). These can be used in methods for the
CC   diagnosis, treatment and prevention of IDDM

PT   Novel promoter used to produce transgenic plants with higher expression
PT   of a desired gene.
XX
PS   Example 1; Page 14; 24pp; English.
XX
CC   The present sequence is a PCR primer used to synthesise carrot CR16.1
CC   fragment. This fragment along with a 10 bp synthetic DNA is used in the
CC   construction of a plant promoter. The promoter is used for controlling
CC   the expression of a desired gene e.g. soybean glycinin, stearoyl-ACP-
CC   desaturase and S-locus type specific RNase gene (male sterility-related
CC   gene) in a host cell especially a microorganism or a plant cell. The
CC   transformed plant cells can be used to produce transgenic plants. The
CC   promoter is compact and therefore suitable for higher expression of a
CC   desired gene in a particular tissue compared to other host tissues

```

CC The present sequence is a PCR primer used for cloning the human inhibitor
CC of apoptosis (IAP)-like protein-2 (ILP-2) DNA. The ILP-2 interacts with
CC transforming growth factor beta receptor (TGFbetaR) and modulates
CC TGFbetaR activity. It also potently inhibits apoptosis induced by
CC overexpression of Bax or by Caspase-9 and Apaf-1. It also activates c-Jun
CC N-terminal kinase (JNK) activity. ILP-2 is used in the area of genetic
CC testing for predisposition to diseases, such as cone-rod retinal
CC dystrophy-2, retinitis pigmentosa, glutaricaciduria, T-cell acute
CC lymphoblastic leukaemia, colorectal cancer and hyperferritinaemia-
CC cataract syndrome owing to an ILP-2 deletion or mutation. The ILP is also
CC used in the treatment of diseases associated with abnormal apoptosis such
CC as cancer, autoimmune diseases, e.g., diabetes and multiple sclerosis and
CC neurodegenerative diseases including retinal degeneration. The ILP-2 gene
CC is also used in gene therapy for treating patients suffering from ILP-2
CC gene deletions or mutations

PT Partitioning endogenous mRNA-protein complexes in vivo, by contacting
PT sample comprising the complex with ligand that binds to a component of
PT the complex and separating complex by binding ligand with a binding
PT molecule.
XX
PS Example 6; Page 31; 49pp; English.
XX
CC The specification describes a method for partitioning endogenous cellular
CC mRNA-protein (mRNP) complexes. The method comprises contacting a
CC biological sample comprising mRNP complex with ligand that specifically
CC binds a component of mRNP complex, separating mRNP complex by binding the
CC ligand with a molecule specific for ligand, which is attached to the
CC solid support and then collecting the mRNP complex by removing the
CC complex from the support. The method is useful for in vivo partitioning
CC of cellular mRNA protein complexes in a biological sample. The method is
CC useful for determining the ribonomic profile of a cell which has numerous
CC uses including monitoring of tumour development, state of growth or state
CC of development, perturbations of a biological system such as disease,
CC drug or toxin treatment and the state of cell aging or death,
CC distinguishing ribonomic profiles among organisms, to discriminate
CC between transcriptional and post-transcriptional contributions to gene
CC expression and to track the movement of RNAs through RNP complexes,
CC including the interactions of combinations of proteins with RNAs in RNP
CC complexes. AAH28281-AAH28316 represent sequences derived from the 3'
CC untranslated region (UTR) of mRNA of various genes. The sequences contain
CC target sequences for RNA-binding proteins

PT Novel DNA construct for creating immune antibody and T-cell receptor
PT libraries, consists of transcription unit comprising promoter/enhancer
PT elements and template encoding RNA transcript.
XX
PS Example 3d; Page 48; 94pp; English.
XX
CC The invention relates to a DNA construct consisting of a transcription
CC unit useful for covalent intracellular joining of selected exons from
CC transcripts of two different genes A and B in a cell in which the genes A
CC and B are expressible, where the transcription unit comprises promoter/
CC enhancer elements and a template for RNA synthesis which encodes an RNA
CC transcript. The RNA transcript has the formula : RCA-SP-RCB. RCA =
CC nucleotide segment having one or more sequences, each reverse-
CC complementary to one or more sequences of pre-mRNA of gene A and genes
CC related to it, where the sequences of pre-mRNA of gene A and genes
CC related to it are situated downstream to an exon selected to be spliced
CC to pre-mRNA of gene B or genes related to it; SP = either a spacer
CC sequence or SP1-LEX-SP2; SP1 and SP2 = spacer sequences; LEX = an exon
CC encoding a flexible peptide linker or its part preceded by branch point
CC and acceptor splice sequences and followed by a donor splice sequence;
CC and RCB = nucleotide segment having one or more sequences, each reverse-
CC complementary to one or more sequences of pre- mRNA of gene B and genes

```
CC   related to it, where the sequences of pre-mRNA of gene B and genes
CC   related to it are situated upstream to an exon in pre-mRNA of gene B or
CC   genes related to it selected to be spliced to the selected exon of gene
CC   A. The DNA construct is useful for constructing a mouse or human antibody
CC   library. A transgenic non-human animal harbouring the construct is useful
CC   for generating a variegated population of cDNA and double-stranded DNA
CC   molecules suitable for preparation of gene libraries encoding scFv
CC   molecules of antibodies or human T-cell receptors (TCRs) of interest. The
CC   construct is useful for generating a human TCR library, preferably a
CC   phage-display library, comprising a variegated population of scFv
CC   molecules of human TCRs of interest expressed and displayed on the
CC   surface of a cell or viral particle. The transgenic animal is useful for
CC   generating an antibody library comprising a variegated population of scFv
CC   molecules of antibodies of interest expressed and displayed on the
CC   surface of a cell or viral particle. The construct is useful for
CC   intracellular functional joining of antibody heavy and light chain genes
CC   in antibody-producing cells, and for the production of invaluable
CC   reagents in medicine, diagnostic research and industry. The construct
CC   allows the faithful reconstitution of entire antibody immune repertoires
CC   in-vitro as libraries of scFvs displayed on phage or other display units,
CC   and such a capacity combines the extraordinary ability of the immune
CC   system to produce specific, high affinity antibodies in response to
CC   antigen, with the fast and easy protocols of in-vitro display
CC   technologies. The present sequence amplifies a fragment from the human
CC   Cgamma gene being a region of the Cgamal-hinge intron predicted to
CC   contain the branch point and peptide linker sequence

PT   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT   or as specific biomolecule capture probes for surface-enhanced laser
PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 15557; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO
CC   at ftp.wipo.int/pub/published_pct_sequence

PT   desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
PS   Disclosure; SEQ ID NO 15559; 214pp; English.
XX
CC   The present invention describes a human genome-derived myosin-like
CC   protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC   1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC   nucleic acids can be used as probes to detect, characterise and quantify
CC   hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC   provide initial substrates for the recombinant engineering of hGDMLP-1
CC   protein variants having desired phenotypic improvements, and for
CC   expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC   used as immunogens to raise antibodies that specifically recognise hGDMLP
CC   -1 proteins, as standards in assays used to determine the concentration
CC   and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC   capture probes for surface-enhanced laser desorption ionisation, as
CC   therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC   production, and in vaccines or for replacement therapy. The
CC   polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC   disorder associated with the expression of hGDMLP-1, in particular heart
CC   and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC   The present sequence represents an oligomer used in the screening of the
CC   hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC   The sequence data for this patent did not form part of the printed
CC   specification, but was obtained in electronic format directly from WIPO

PT   Arraying genome clones.
XX
PS   Claim 4; Page 10; 528pp; Japanese.
XX
CC   The present invention describes a method of arraying genome clones. The
CC   method comprises: (a) clones of the genomic libraries contained in
CC   multiwell plates numbered for discrimination are mixed in each of the
CC   multiwell plates; (b) a primer designed based on the chromosome marker
CC   sequence is added to the mixture to carry out an amplification reaction;
CC   (c) a signal corresponding to the marker is detected from the resultant
CC   amplified product to specify the discrimination Nos. of the multiwell
CC   plates containing the clones having said marker sequence; (d) the order
CC   of the markers is changed so that the same discrimination Nos. succeed to
CC   the maximum in the specified discrimination Nos. to array the multiwell
CC   plates; (e) the clones in the multiwell plates of the specified
CC   discrimination Nos. are mixed respectively in each wells of longitudinal
CC   and lateral directions; (f) the mixed clones are cultured and the
CC   resultant cultures are amplified by using the above primer; (g) signals
CC   are detected from the amplified products; (h) the clones in the multiwell
CC   plates are specified from the detected result; and (i) the clones are
CC   reconstituted as the positions on the chromosome and arrayed. The
CC   microarray is useful for gene analysis. ABL42957 to ABL45322 represent
CC   PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634

PT   New nucleic acid molecule encoding chimeric proteins with binding
PT   specificity for a site on HIV envelope glycoprotein gp120 and a site on
PT   gp120 protein or on the extracellular portion of human CD4, for
PT   preventing or treating HIV infection.
XX
PS   Example 1; Page 23; 48pp; English.
XX
CC   The invention discloses a nucleic acid molecule encoding a functional
CC   chimeric protein with binding specificity for at least two different
CC   sites. At least one site is on the human immunodeficiency virus-1 (HIV-1)
CC   envelope glycoprotein (env), gp120, and the other site is either on the
CC   gp120 protein or on the extracellular portion of human CD4, the major
CC   cellular receptor for HIV. The chimeric protein essentially comprises a
```

CC first binding region of a soluble extracellular portion of human CD4,
CC consisting of the immunoglobulin (Ig) variable region-like membrane
CC distal domains (V1 and V2) and a second binding region of a variable
CC region of an antibody heavy chain (VH), encoded by the VH3 gene, which is
CC capable of being attached to an adjacent and non-overlapping site on the
CC gp120 protein, or to a site on the extracellular portion of human CD4,
CC and is capable of increasing the capacity of the extracellular portion of
CC human CD4 to interact with gp120 and to block the interaction of HIV with
CC membranal CD4. These two binding regions are physically connected by a
CC linker region. The chimeric protein of the invention is useful for gene
CC therapy and for preventing and treating an HIV infection and for
CC neutralising and inhibiting virus replication and infectivity in a
CC subject, preferably a mammal. The sequence presented is the PCR primer,
CC 25657, which was used to amplify the human constant (C) gamma heavy chain
CC domain, CH1, gene of the Ig chain used in the construction of the
CC chimeric protein

PT Determining a toxicological response to an agent, useful for screening of
PT drugs, comprises comparing the expression profile of one or more human
PT toxic response genes to a reference gene expression profile indicative of
PT toxicity.
XX
PS Claim 1; Page 326; 455pp; English.
XX
CC The present invention describes a method (M1) for determining a
CC toxicological response to an agent, which comprises comparing the
CC expression profile of one or more human toxic response genes to a
CC reference gene expression profile indicative of toxicity, and so
CC determining the presence of a toxic response to the agent. Also
CC described: (1) an array comprising one or more polynucleotides selected
CC from the genes corresponding to the partial sequences given in ABZ82842
CC to ABZ84764, or their fragments of at least 20 nucleotides, or homologues
CC ; and (2) determining if a gene putatively identified to be a toxic
CC response gene plays a role on toxic response pathways by determining the
CC expression profile of the gene after exposure of cells or a human subject
CC to a known toxic pharmaceutical or industrial agent, comprising: (a)
CC exposing cells to an agent or isolating cells from a human subject who
CC was exposed to an agent; (b) obtaining the test gene expression profile
CC for a putatively identified toxic response gene after exposure to a known
CC toxic pharmaceutical or industrial agent; and (c) comparing the test
CC profile to the expression profile of a gene with a similar function or
CC comparing the test profile to the expression profile of that gene after
CC exposure to other known toxic compounds. The methods are useful for
CC predicting and determining toxicological responses on a cellular, organ
CC or system level. The arrays comprising the human genes are useful for
CC toxicological screening of drugs, pharmaceutical compounds and chemicals

PT New murine calcium activated chloride channel (mCLCA4) for identifying
PT mCLCA4 expression regulatory factors for treating respiratory mucin
PT production associated disease conditions, e.g. chronic bronchitis, and
PT asthma.
XX
PS Example 5; Col 44; 39pp; English.
XX
CC The invention relates to methods and compositions for modulating mucin
CC secretion by respiratory system cells. The invention also provides murine
CC calcium activated chloride channel, CLCA4 and human CLCA2 polypeptides
CC and polynucleotides. CLCA2 sequences are used to diagnose the presence of
CC mucin secretion respiratory system associated disease conditions in host.
CC CLCA2 modulators are useful for preparing a composition for the treatment
CC of respiratory mucin production associated disease conditions such as
CC asthma, chronic bronchitis, chronic obstructive pulmonary disease (COPD),
CC cystic fibrosis or bronchiectasis. Sequences of the invention are used in
CC the identification of mCLCA4 homologues, as a source of new promoter

```
CC   elements, in the identification of mCLCA4 expression regulatory factors,
CC   as probes and primers in hybridisation applications, in identification of
CC   expression patterns in biological specimens and in the preparation of in
CC   vitro models for mCLCA4 function. The present sequence is a probe used in
CC   human mucin gene expression studies

PT   Detecting nucleic acid having two portions, by providing nanoparticles
PT   having oligonucleotides attached to it, contacting nucleic acid and
PT   nanoparticles to allow hybridization, and observing detectable change.
XX
PS   Disclosure; Fig 68; 467pp; English.
XX
CC   The invention relates to a method of detecting a nucleic acid having two
CC   portions. The method involves providing nanoparticles having
CC   oligonucleotides attached to it which has a sequence complementary to
CC   sequence of two portions of nucleic acid, contacting nucleic acid and
CC   nanoparticles to allow hybridisation of oligonucleotides with two or more
CC   portions of nucleic acid and observing a detectable change brought about
CC   by hybridisation. The method and aggregate probes are useful for
CC   detecting two or more nucleic acids (from a biological source) having at
CC   least two portions such as viral RNA, bacterial or fungal DNA, a gene
CC   associated with a disease, synthetic or structurally modified natural or
CC   synthetic RNA or DNA, or a product of a polymerase chain reaction
CC   amplification. The invention is useful for preparing a nanoprobe
CC   conjugate for detecting an analyte and for detecting a nucleic acid bound
CC   to an electrode surface. It is also useful for fabrication and for
CC   separating a selected nucleic acid having two portions from other nucleic
CC   acids. The present sequence is an oligo used to illustrate the method of
CC   the invention

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 99036; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT   Producing binary sequence tags, useful for analyzing nucleic acid
PT   sequence tags, gene expression or gene-expression patterns, involves
PT   generating nucleic acid fragments, which are mixed with offset adaptors
PT   and adaptor-indexers.
XX
PS   Disclosure; Page 101; 101pp; English.
XX
CC   The present invention describes a method of producing binary sequence
CC   tags from nucleic acid fragments in a sample, involving incubating the
CC   sample with cleaving reagents, mixing offset adaptors with the sample,
CC   incubating with more cleaving reagents and mixing the sample with adaptor
CC   -indexers where the adaptors are coupled to binary sequence tags. The
```

```
CC   method is useful in sequence analysis, including analysis and comparison
CC   of gene expression, nucleic acid samples and genomes

XX
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

PT   DNA fragment coding for Papillomavirus antigenic proteins - and derived
PT   immunogen, vaccine and antibody.
XX
PS   Claim 6; Page 16; 25pp; French.
XX
CC   The inventors claim DNA fragments capable of expressing, in a host, a
CC   prod. contg. at least one antigenic determinant of papillomavirus (PV),
CC   (see AAN30170-N30173). Also claimed are immunogens consisting of at least
CC   one peptide sequence coded for by the DNA fragments (see AAP30310-
CC   P30313), vaccines contg. the immunogens and antibodies raised from them.
CC   The vaccines are useful in human and veterinary medicine and the
CC   antibodies are useful as diagnostic reagents. The DNA fragments are most
CC   esp. derived from the L1 region of human PV type 1a

PT   Detecting target nucleic acid molecules - using excess complementary
PT   nucleic acid probes and nicking to complete a cycling sequence.
XX
PS   Disclosure; Page 25; 34pp; English.
XX
CC   Probe #300 is used by reacting it in excess with a target nucleic acid;
CC   nicking hybridised probe at least once within a predetermined sequence to
CC   form 2 or more probe fragments hybridised to the target sequence, which
CC   results in the probe fragments becoming hybridised to another probe; and
CC   identifying probe fragments, so detecting the target sequence. The probe
CC   can react with target sequence to complete a cycling sequence. Using this
CC   system, sensitivity of 10 exp. -19 to 10 exp. -20 molecules of target can
CC   be obtd. The probe is cleavable at the ribonucleotides by a ds RNase, eg
CC   RNase H or ExoIII. (Updated on 31-OCT-2002 to add missing OS field.)

PT   New oligomers contg. modified bases - which form a triplex with G-C
PT   doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT   herpes malignancy and inflammation.
XX
PS   Claim 12; Page 72; 77pp; English.
XX
CC   The synthetic oligomer is capable of forming a triplex at physiological
CC   pH with a purine rich target sequence by coupling into the major groove
CC   of the duplex. The specific target sequence of this oligomer is the human
CC   tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg.
CC   a purine rich sequence concd. on one strand of the duplex. The oligomer,
CC   and others like it are useful in diagnosis and therapy of diseases
CC   characterised by specific DNA duplex targets, e.g. HPV, HER, HIV,
CC   hepatitis B, herpes, malignant tumours and inflammation. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. See also AAQ25452-25501

PT   herpes malignancy and inflammation.
XX
PS   Claim 11; Page 64; 77pp; English.
XX
CC   The sequence depicts a HUMNFR (tumour necrosis factor receptor) mRNA
```

```
CC   sequence beginning at nucleotide 2354. The sequence is a viral duplex
CC   sequence contg. a purine-rich region concentrated on one chain of the
CC   duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR
CC   duplex sequence is used as a target for novel oligomers which are capable
CC   of forming a triplex at physiological pH by coupling into the major
CC   groove of the DNA duplex. Three such oligomers TNFR 941-32 are capable of
CC   forming a triplex with this sequence. The oligomers are used in the
CC   treatment of inflammation. Similar oligomers may be used to target viral
CC   DNA duplexes specific for HIV, herpes and other viruses. The triple
CC   helices form under mild conditions thus assays may be carried out without
CC   subjecting the test specimen to harsh conditions. The oligomer is able to
CC   inhibit gene expression, as verified by in vitro systems. See also
CC   AAQ25452-25500 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN
CC   field.)

PT A process for purification of oligonucleotides using liquid
PT chromatography.
XX
PS Example 1; Page 4; 13pp; Japanese.
XX
CC The present sequence is an oligonucleotide provided in a specification
CC relating to the simplified purification of oligonucleotides by liquid
CC chromatography. The process comprises: (a) pouring oligonucleotides
CC protected with a hydrophobic group and oligonucleotide with no protective
CC group into a liquid chromatography column packed with an acid and alkali
CC resistant packing agent, such as polystyrene resin; (b) pouring a mixed
CC developing solvent composed of a buffer made from a volatile salt and a
CC water soluble organic solvent at a suitable concentration gradient into
CC the column; (c) pouring an acid, particularly 6-16 v/v% acetic acid, into
CC the column to deprotect the oligonucleotides protected with the
CC hydrophobic group; (d) pouring a mixed developing solvent composed of a
CC buffer made from a volatile salt, particularly 0.05-0.5 N aqueous
CC ammonium hydrogencarbonate solution adjusted at pH 8-10, and a water
CC soluble organic solvent at a suitable concentration gradient to elute the
CC deprotected oligonucleotides; and (e) removal of the solvent and the salt
CC from the eluted oligonucleotides

PT Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ubiquinone.
XX
PS Disclosure; SEQ ID NO 6900; 872pp; English.
XX
CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

CC   The present sequence represents a 3'-untranslated region (3'UTR) fragment
CC   of ribonucleotide reductase R1. The present invention describes: (1)
CC   oligonucleotides (ON) comprising at least 7 consecutive nucleotides (nt)
CC   or their analogues of a UTR of a housekeeping gene; (2) antisense ON
CC   (AON) complementary to ON; (3) ribozymes (Rb) complementary or homologous
CC   to ON, and able to cleave it; (4) DNA sequence encoding ON, OAN and Rb;
CC   (5) an antibody (Ab) that binds to ON, OAN and Rb; (6) a nt probe ntP
CC   that hybridise to ON, OAN and Rb. ON, AON, Rb and Ab are used to modulate
CC   (especially inhibit) growth of tumour cells (especially neoplastic cells)
CC   and to reduce their capacity for metastasis. The above may also be used
CC   to treat benign proliferative disorders e.g. papillomas, atherosclerosis,
CC   angiogenesis and viral infections, e.g. human immunodeficiency virus,
CC   hepatitis or herpes. ON may further be used: (i) to identify modulators
CC   of tumour growth/metastasis; (ii) to identify compounds (especially
CC   potential antitumour agents) that inhibit or enhance interaction between
CC   ON and its binding substances; (iii) as probes for detecting related
CC   sequences, and (iv) to generate Ab, used for detection and quantification
CC   of UTR especially for monitoring progress of cancer therapy. SON inhibit
CC   tumorigenicity of neoplastic cells, particularly where these are
CC   resistant to hydroxyurea

PT   Determining common functional alleles in a population - useful in the
PT   diagnosis of disease associated with allelic heterogeneity.
XX
PS   Example 1; Page 24; 78pp; English.
XX
CC   The invention relates to methods of determining a functional allele
CC   profile of a gene in a population. Functional allele profiles comprise
CC   the commonly occurring alleles in a population, and the relative
CC   frequencies at which such alleles of a given gene occur. The methods are
CC   used to identity and determine the frequency of the functional alleles of
CC   genes which display extensive allelic heterogeneity, particularly those
CC   implicated in disease or conditions, such as the BRCA1 gene associated
CC   with breast cancer, CFTR associated with cystic fibrosis, dystrophin
CC   associated with Duchenne muscular dystrophy and Becker muscular
CC   dystrophy, and p53 associated with Li-Fraumeni syndrome. The methods can
CC   also be employed for diseases where allelic and genetic heterogeneity
CC   exist, such as breast cancer, neurofibromatosis, and hereditary non-
CC   polyposis colorectal cancer. Identification of functional alleles is
CC   necessary for identification of mutations which may be implicated in the
CC   disease. Sequences AAX32001-172 represent primers for determining the
CC   functional allele profiles of various genes. The primers are specific for
CC   genes such as MSH2 gene, MLH1 gene, BRCA1 gene, BRCA2 gene and BAP1 gene

PT   Isolated genes (Gene 216) from human chromosome 20p13-p12 and the
PT   proteins they encode, useful for the prevention, diagnosis and treatment
PT   of asthma, obesity and inflammatory bowel disease.
XX
PS   Example 10; Page 150; 520pp; English.
XX
CC   The invention relates to isolated genes (Gene 216) from human chromosome
CC   20p13-p12 and the proteins they encode. The nucleic acids and proteins
CC   may be used in the prevention, diagnosis and treatment of diseases
CC   associated with inappropriate Gene 216 expression. For example, the
CC   nucleic acids (or vectors) and proteins may be used to treat disorders
CC   associated with decreased expression by rectifying mutations or deletions
CC   in a patient's genome that affect the activity of gene 216 by expressing
CC   inactive proteins or to supplement the patients own production of Gene
CC   216 proteins. Additionally, the nucleic acids may be used to produce the
CC   secreted Gene 216 protein, by inserting the nucleic acids into a host
CC   cell and culturing the cell to express the protein. The nucleic acids and
CC   complementary sequences may also be used as DNA probes in diagnostic
CC   assays to detect and quantitate the presence of similar nucleic acid
CC   sequences in samples and therefore which patients may be in need of
CC   restorative therapy. The Gene 216 protein may also be used as antigens in
CC   the production of antibodies against Gene 216 and in assays to identify
CC   modulators of Gene 216 expression and activity. The anti-Gene 216
CC   antibodies and antagonists may also be used to down regulate expression
CC   and activity. The anti-Gene 216 antibodies may also be used as diagnostic
CC   agents for detecting the presence of Gene 216 proteins in samples (e.g.
CC   by enzyme linked immunosorbant assay or ELISA). Disorders that may be
CC   prevented, diagnosed and/or treated by the above methods include, for
CC   example asthma, obesity and inflammatory bowel disease. The present
CC   sequence is that of a Gene 216 related primer used in examples of the
CC   invention. The primers are used in the physical mapping of the gene
CC   (ABZ72067-ABZ72088), polymorphism identifiction using single strand
CC   conformational polymorphism (SSCP) analysis (ABZ72091-ABZ72184),
CC   sequencing (ABZ72185-ABZ72268) and genotyping (ABZ72317-ABZ72362)

CC The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.

PT   chronic obstructive pulmonary disease, obesity or inflammatory bowel
PT   syndrome.
XX
PS   Example 10; Page 156; 650pp; English.
XX
CC   This invention relates to a novel isolated nucleic acid, gene 216,
CC   identified from human chromosome 20p13-p12. The invention also discloses
CC   regions of the 216 gene that contain single nucleotide polymorphisms
CC   (SNP's) which may be used as markers for disease susceptibility or
CC   severity. The nucleotides of the invention may have antiasthmatic,
CC   antiinflammatory or anorectic activities and may be used in gene therapy.
CC   The nucleic acids, antibodies or its fragments are useful for diagnosing,
CC   preventing or treating a disorder, such as respiratory diseases (e.g.
CC   asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary
CC   disease or adult respiratory distress syndrome), obesity, or inflammatory
CC   bowel syndrome. The nucleic acids are also useful for identifying
CC   increased susceptibility of a subject to the disorders mentioned. The
CC   nucleic acids can also be used as primers and templates for the
CC   recombinant production of disorder-associated peptides or polypeptides,
CC   for chromosome and gene mapping, or for tissue distribution studies. The
CC   present sequence represents a gene 216 specific PCR primer used in the
CC   scope of the invention

PT   Determining a functional allele profile of a gene in a population by
PT   identifying the nucleotide sequence of a gene of genomic DNA from each of
PT   the individuals with a family history of functional alleles of the gene
PT   of interest.
XX
PS   Example 1; Page 9; 28pp; English.
XX
CC   The present invention relates to a method for determining a functional
CC   allele profile of a gene in a population. The method comprises
CC   identifying the nucleotide sequence of a gene of interest out of genomic
CC   DNA from each of a population of individuals identified as having a
CC   family history which indicates inheritance of functional alleles of the
CC   gene of interest, and rank ordering the frequency of occurrence of each
CC   haplotype, where the identity of the alleles containing each haplotype
CC   and the determination of their relative frequencies constitutes the
CC   functional allele profile of the gene of interest in the population. The
CC   method is useful for determining functional allele profiles which are
CC   useful in the treatment and diagnosis of diseases, for genetic and
CC   pharmacogenetic applications, and for evaluating the degree to which the
CC   gene(s) are under selective pressure. The present sequence represents a
CC   PCR primer used in the method of the invention.

CC   This invention describes a novel method for identifying an inhibitor
CC   potentially useful for treatment of cancer, where the inhibitor is active
CC   on a gene vital for cell growth or viability, and where the gene is
CC   subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC   used for preventing the development of cancer in a patient having a
CC   precancerous condition, by administering to the patient a first allele
CC   specific inhibitor (ASI) targeted to an allele of a first essential gene
CC   present in cells of the precancerous condition, where the normal somatic
CC   cells of the patient are heterozygous for the first gene, the inhibitor
CC   is active on at least one but less than all allelic forms of the gene
CC   present in a population and targets only one allelic form present in the
CC   normal somatic cells, and the first gene. The products and methods can be
CC   used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC   cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC   lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC   graft versus host disease. The method can also be used to remove
CC   malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC   human polymorphic sites described in the method of the invention

PT   Novel isolated nucleic acid encoding a promoter which is capable of
PT   driving chemically inducible but not wound- or pathogen-inducible
PT   expression of an associated nucleotide sequence.
XX
PS   Example 3; Page 30; 88pp; English.
XX
CC   The invention relates to an isolated nucleic acid molecule (a promoter of
CC   rice chemically induced cDNA (RCI-1), which encodes a lipoxygenase)
CC   capable of driving chemically-inducible but not wound- or pathogen-
CC   inducible expression of an associated nucleotide sequence. Also included
CC   are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the
CC   lipoxygenase gene, promoter fragments, the lipoxygenase transit peptide
CC   which directs expressed proteins to the plastid, a vector comprising the
CC   promoter or fragments and a transgenic plant comprising the vector. The
CC   promoter or fragments are useful for expressing a nucleotide sequence of
CC   interest. The transit peptide is useful for targeting an associated
CC   protein of interest to plastids. A nucleic acid which expresses
CC   polypeptide having lipoxygenase activity is useful for inhibiting fungal
CC   mycotoxins when transformed into a plant. The lipoxygenase is useful for
CC   inhibiting fungal mycotoxins. The promoter is useful for regulating
CC   transcription of a chemically inducible but not wound or pathogen
CC   inducible gene, which involves applying a chemical regulator to a plant
CC   or seed containing a chemically regulatable nucleotide sequence.
CC   Transgenic plants as described above are useful for breeding improved
CC   plant lines that for example increase the effectiveness of conventional
CC   methods such as herbicide or pesticide treatment or allow to dispense
CC   with the methods due to their modified genetic properties. New crops with
```

```
CC   improved stress tolerance can be obtained that, due to their optimised
CC   genetic equipment yield harvested product of better quality than products
CC   that were not able to tolerate comparable adverse developmental
CC   conditions. The present sequence is an anchored oligo-dt reverse RT-PCR
CC   primer (reverse transcriptase PCR) used to isolate the cDNA encoding rice
CC   lipoxygenase

PT   Novel replicase complex comprising hepatitis C virus NS5B replicase, a 3
PT   nucleotide-long template to which a 2 nucleotide-long primer is annealed,
PT   and template and primer which do not form a stable duplex in the absence
PT   of HCV NS5B.
XX
PS   Example; Page 6; 17pp; English.
XX
CC   The invention relates to a replicase complex comprising a hepatitis C
CC   virus (HCV) NS5B replicase protein, a linear nucleic acid template and a
CC   complementary nucleic acid primer which is annealed to the 3' terminus of
CC   the template, where the template is at least three nucleotides and the
CC   primer is two or three nucleotides, and the template and primer do not
CC   form a stable duplex in solution in the absence of the HCV NS5B protein.
CC   The complex is useful for detecting HCV replicase activity and permits
CC   establishment of sensitive RNA-dependent RNA polymerase assays to screen
CC   and evaluate antiviral inhibitors and to improve the specificity and
CC   efficacy of the inhibitors. The complex is also useful in the development
CC   of a reliable system for determining kinetic and thermodynamic constants
CC   of HCV NS5B-catalysed nucleotide incorporation and investigation of
CC   mechanistic inhibitors for mis-incorporation or chain termination.
CC   Specifically, the short RNA template and primer pairs are useful in
CC   screening assays which are used for determining kinetic, thermodynamic
CC   and mechanistic properties of NS5B replication and ultimately in the
CC   development of inhibitors of NS5B. Newly identified inhibitors of
CC   replicase activity may be used for developing anti-HCV pharmaceuticals.
CC   Sequences ABK99271-ABK99296 represent HCV NS5B replicase RNA synthesis
CC   templates

PT   Use of amplification primer-mixture and human papillomavirus genus-
PT   specific hybridization probes, for detecting and genotyping human
PT   papillomavirus in biological samples.
XX
PS   Claim 2; SEQ ID NO 10; 61pp; English.
XX
CC   The present invention describes a method for detecting many human
CC   papillomavirus (HPV) genotypes from biological samples. The method
CC   comprises amplifying and hybridising the extracted nucleic acid molecules
CC   with HPV genus-specific primers and probes designed from HPV genomic
CC   regions. Amplification primer-mixtures, consensus primers, type-specific
CC   primers, hybridisation probes, and reagent kits of the present invention
CC   can be used for detecting and genotyping HPV. The primer mixture is
CC   useful for the amplification of the 3, 4, 6, 7, 9, 10, 11, 12, 13, 14,
CC   16, 18, 20, 24, 26, 28, 29, 30, 31, 32, 33, 34, 35, 36, 39, 39, 40, 41,
CC   42, 44, 45, 51, 52, 53, 54, 55, 56, 58, 49, 60, 61, 66, 67, 68, 72, 74 or
CC   77 genotypes of HPV. The HPV genomic regions are useful for designing HPV
CC   genus-specific and HPV genotype-specific hybridisation probes. The
CC   present sequence is used in the exemplification of the present invention.

PT Identifying, isolating and regulating senescence-related genes - useful
PT to ameliorate problems associated with accumulation of senescent cells,
PT e.g. age-related lipofuscin accumulation in the retina and AIDS.
XX
PS Claim 6; Page 25; 135pp; English.
XX
CC AAT28044-T28075 represent primers for human fibroblasts in enhanced
CC differential display (EDD), which is used in conjuncture with the method
CC of the invention. EDD is an mRNA preparation method. AAT28044-T28055
CC represent T-rich 3'-primers, while AAT28056-T28075 are randomly selected
CC 5'-primers used in EDD of human fibroblasts. The 3'-primers used are
CC complementary to the poly-A tail of the mRNA. In the method of the
CC invention, mRNA is isolated from a senescent cell, and a young quiescent
CC cell, and the mRNAs are amplified in separate reaction mixtures. The
CC amplified sequences are then separated by size or charge, and the
CC products are analysed to identify a gene from young quiescent cells and
CC dividing cells, that is present at a different level from senescent
CC cells. The method can be used for the rapid and efficient identification
CC and isolation of senescence-related genes and gene products, and to
CC detect and distinguish between senescent and non-senescent cells. It can
CC also be used to destroy cells expressing senescence specific (or related)
CC gene products, and to screen for compounds capable of altering gene
CC expression in senescent cells. The method can also be used to ameliorate
CC problems associated with the accumulation of senescent cells such as age-
CC related lipofuscin accumulation in the retina, and in the treatment of
CC AIDS. Also, the method can be used to distinguish young cells from
CC senescent cells in donor tissue, which is useful in removing senescent
CC melanocytes overexpressing melanin which cause hypopigmentation, or liver
CC spots

PT Detection of differentially expressed mRNA mols. - using two-step
PT polymerase chain reaction amplification method.
XX
PS Claim 9; Col 17; 15pp; English.
XX
CC An improved method of Differential Display, named Enhanced Differential
CC Display (EDD) has been designed as a technique for screening differences
CC in gene expression between various cell types or between different stages
CC of cell development. The technique is highly reproducible, leading to
CC precise typing of the expressed genes in any given cell. EDD analysis
CC permits the identification of novel genes involved in differentiation,
CC aging and disease, and enables direct comparisons of different cell types
CC and disease states. By using longer primers, and/or an alteration in the
CC annealing temperatures, the number of false positives can be reduced.
CC First, cDNA is prepared from total cellular RNA using 12 different 22-
CC base oligonucleotides (AAT58484-95) that are targeted to the poly A tail
CC of pol II mRNA transcripts. The last two bases of each primer varies so
CC as to anchor the primer to the 3' end of different sets of mRNAs. A
CC second set of 12 22-base oligo primers (AAT58472-83) is designed to
CC randomly select a subset of cDNAs from each of the twelve 3' primers. PCR
CC amplification of a subset of cDNAs is carried out in a two step process
CC using particular 5' and 3' primers. The amplified gene products can then
CC be directly sequenced or rapidly subcloned for DNA sequencing

PT New isolated Aspergillus oryzae signaling sequences, used to increase the
PT production of polypeptides by recombinant host filamentous fungal cells.
XX
PS Example 2; Page 35; 78pp; English.
XX
CC Sequences AAZ47342-Z47353 are oligo(dT12N2) primers used in the
CC differential display analysis of the Aspergillus oryzae strains HC4.01
CC and 27. The strains were analysed to find the genetic basis for phenotype
CC differences in the strains which are used in a method for producing a
CC polypeptide in an enhanced amount. The method involves cultivating a
CC mutant of a parent filamentous fungal cell in suitable nutrient medium.
CC The mutant cell contains the nucleotide sequence encoding the polypeptide
CC to be synthesised and one or more second nucleotide sequences encoding a
CC DDC polypeptide (see AAZ47338-Z47339). The mutant cell produces more of
CC the polypeptide than the parent cell and the polypeptide can be recovered
CC from the nutrient medium of the mutant cell. The method can be used for
CC the production of polypeptides such as hormones, receptors, antibodies,
CC reporters or enzymes, e.g. an aminopeptidase, amylase, carbohydrase,
CC carboxypeptidase, catalase, cellulase, chitinase, cutinase, cyclodextrin

CC The present invention describes a differential indication PCR (polymerase
CC chain reaction) technique which is used to obtain a new complete gene
CC able to promote the repair of damaged liver cells and with substance
CC total length of 0.7 kb by screening the cDNA library of human foetal
CC liver. The induction expression of engineering bacteria, the separation
CC and cracking of inclusion body and the process for restoring and
CC decontaminating proteins are built up to obtain high purity recombinant
CC human hepatocyte auxin. It can externally promote the reproduction of
CC primary culture liver cells and liver cancer cells BEL-7402 and
CC internally promote the synthesis of mouse liver cell DNA after CCL4 is
CC damaged and the repair of liver cells. The method may be used to treat
CC serious hepatitis, chronic hepatitis, liver fibrosis and cirrhosis. The
CC present sequence represents a primer which is used in the exemplification
CC of the present invention

PT   New compositions comprising sensor arrays made up of unique probe
PT   oligonucleotides - useful for characterizing a sample of target deletion
PT   oligonucleotides.
XX
PS   Example 9; Page 99; 163pp; English.
XX
CC   This invention describes a novel composition comprising a number of
CC   sensor arrays, where each array comprises a unique probe oligonucleotide,
CC   which is the reverse complement of part of a unique target
CC   oligonucleotide present in a mixture of target deletion sequence
CC   oligonucleotides. The compositions form a method for characterizing a
CC   sample of target deletion oligonucleotides which are labelled and
CC   hybridize with the probe oligonucleotides of the sensor arrays. Such
CC   oligonucleotides and their targets are represented in AAX23548-X23709.
CC   Oligonucleotides characterized by the method form pharmaceutical
CC   compositions that are useful for modulating cellular adhesion or
CC   proliferation, and being active against a eukaryotic pathogen, a human
CC   retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC   retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC   Syncytial Virus or cytomegalovirus (CMV). The compositions enable
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   Novel maize cytochrome P450 monooxygenase cDNA used to confer herbicide
PT   resistance to plants.
XX
PS   Example 1c; Fig 5; 85pp; English.
XX
CC   The invention relates to maize cytochrome P450 monooxygenase CYP71C3v2
CC   (AAY77232) and nucleotides which encode it. CYP71C3v2 cDNA was generated
CC   via reverse transcriptase-PCR (RT-PCR) from poly (A)+ mRNA isolated from
CC   naphthalic anhydride and herbicide (triasulfuron)-treated maize
CC   seedlings. This was used to construct a cDNA library, which was screened
CC   using previously generated cDNA as hybridisation probes. The CYP71C3v2
CC   cDNA clone was extended via 5' RACE (rapid amplification of cDNA ends)
CC   and cloned into pBluescript. Genomic DNA was also screened for clones
CC   encoding CYP71C3v2 - this was found to contain 2 introns (AAZ87321-
CC   Z87322). Cytochrome P450 monooxygenase CYP71C3v2 reductively cleaves
CC   molecular dioxygen to produce functionalised organic substrates.
CC   Nucleotides encoding cytochrome P450 monooxygenase CYP71C3v2 are used to
CC   produce transgenic plants with increased resistance to herbicides, such
CC   as triasulfuron. When such transgenic plants are grown, undesired
CC   vegetation such as pigweed, velvet leaf, lambs quarters, Chenopodium
CC   album and quack grass, can easily be controlled. The methods may also be
CC   used to identify those compounds with herbicidal activity. Sequences
CC   AAZ87323-Z87335 represent PCR primers used to isolate, clone and study
CC   maize CYP71C3v2 nucleotide sequences in the exemplifications and the
CC   disclosure of the present invention

PT   Novel genes from Candida albicans, useful for screening for antifungal
PT   drugs for treatment or prevention of fungal infection.
XX
PS   Example 5; Page 36; 139pp; English.
XX
CC   This sequence represents a primer used in the amplification of the
CC   Candida albicans gene CaOR110 nucleotide sequence. The invention relates
CC   to eight nucleotide sequences representing essential C. albicans genes,
CC   and the polynucleotides that they encode. An antibody against the
CC   polypeptides, and a method for screening for antimycotic substances using
CC   one of the essential genes or the peptides encoded by them as a target is
CC   also included in the invention. The method may be used to screen for
CC   substances that inhibit the expression of the target essential Candida
CC   albicans or Aspergillus fumigatus genes or inhibit the activity of
CC   essential proteins from these species. This method is particularly useful
CC   for screening for inhibitors of dihydropteroate synthase (DHPS) and/or
CC   7,8-dihydro-6-hydroxymethylpterin-pyrophosphokinase (HPPK). The method
CC   may also be used to identify antimycete substances acting on other mycete
CC   species. These inhibitors may be used to treat infections caused by these
CC   organisms or may be used prophylactically to prevent infection in
CC   immunosuppressed individuals. The nucleotide sequences may be used to
CC   identify functionally similar genes in other mycete species, and may also
CC   be used as a probe to screen a C. albicans genomic library. The genes and
CC   polypeptides may also be used to identify fungal infections. The new
CC   method of screening for antimycotic substances using essential genes or
CC   protein allows the identification of drugs which will only inhibit growth
CC   of specific mycete species

CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PT   Producing protein or DNA libraries which are useful for improving
PT   existing proteins, by in vitro translating protein coding sequences to
PT   produce RNA-protein fusions and incubating these protein fusions under
PT   high salt conditions.
XX
PS   Disclosure; Page 43; 121pp; English.
XX
CC   The present sequence is one of a number of oligonucleotides which were
CC   used for the generation of RNA-protein fusions, including fusions having
CC   a myc epitope tag. The RNA-protein fusions comprise a protein covalently
CC   linked to the 3' end of its own mRNA. This is accomplished by synthesis
CC   and in vitro or in situ translation of an mRNA molecule with a peptide
CC   acceptor attached to its 3' end. The RNA-protein fusions are incubated
CC   under high salt conditions to produce a protein library. This method is
CC   useful for improving or altering existing proteins, as well as for
CC   isolating new proteins and nucleic acid or small molecule targets. It may
CC   also be used to improve human or humanised single-chain antibodies for
CC   the treatment of a number of diseases. The method is useful for the
CC   isolation of proteins with specific binding properties, for screening
CC   cDNA libraries and cloning new genes on the basis of protein-protein
CC   interactions. Unlike prior art, the new method does not rely on
CC   maintaining the integrity of an mRNA:ribosome:nascent chain ternary
CC   complex, which is very fragile and is therefore of limited use. The
CC   method does not rely on topological links between the protein and the
CC   nucleic acid so that the information of the protein is retained and can
CC   be recovered in readable, nucleic acid form

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 5; Page 33; 62pp; English.
XX
CC   The present sequence is an oligonucleotide probe that was used in a
CC   molecular beacon in an example from the invention. The probe forms a
CC   hairpin structure in the native state. The 5' end of the probe is
CC   covalently joined via a linker to a disulfide or primary amine. The 3'
CC   end of the probe is covalently joined to an amine-reactive fluorescent
CC   dye such as fluorescein. A gold surface or other metal film surface is
CC   attached to the disulfide or amine group to form the molecular beacon. In
CC   the native state with hybridised termini, the proximity of the
CC   fluorophore and quencher (gold surface) in the molecular beacon is such
CC   that little or no fluorescence is detectable. Upon hybridisation of the
CC   central complementary stretch of the probe to a target sequence (e.g. the
CC   sequence in ABL57070), the hairpin undergoes a conformational change
CC   resulting in an increase in fluorescence, the extent of which is
CC   proportional to the amount of binding partner present. The invention
CC   relates generally to the use of metal surface quenchers such as particles
CC   or films for high sensitivity applications in, for example, detection and
CC   diagnostic systems

PT   Novel protein from Brassica campestris, useful as antimicrobial against
PT   plant pathogenic filamentous fungi or pathogenic bacteria, especially for
PT   treating e.g. rice white leaf blight and sheath blight disease.
XX
PS   Example 1; SEQ ID NO 7; 34pp; Japanese.
XX
CC   The invention comprises the amino acid and coding sequences of
CC   antimicrobial (defensin) proteins from Brassica. The DNA and protein
CC   sequences of the invention are useful for producing transformed plants
CC   with composite disease resistance, especially resistant to diseases
CC   caused by pathogenic bacteria, such as: rice white leaf blight, brown-
CC   stripe disease, glume blight, and seedling damping-off disease. As well
CC   as diseases caused by filamentous fungi, such as: rice blight, sheath
CC   blight disease, and leaf blight. The present DNA sequence represents a
CC   PCR primer that was used in the exemplification of the invention.

CC   The present invention provides a method for identifying a set of
CC   extendible primers which can be used in the identification, typing and
CC   classification of genes. This can then be used to predict protein
CC   sequence and structure, in organ donation to match the organ with the
CC   receiver, and to identify bacteria in a sample. The method can be used to
CC   type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
CC   particular

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5561; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

XX
PS   Example 1; Page 22; 62pp; English.
XX
CC   The present sequence is an oligonucleotide probe that was used in a
CC   molecular beacon in examples from the invention. The probe has a hairpin
CC   structure in the native state. The disulfide group at the 5' end of the
CC   probe was covalently linked to the 5' phosphate via a (CH2)6 spacer, and
CC   the primary amino group at the 3' was attached to the 3' hydroxyl via a
CC   (CH2)7 spacer. An amino-reactive dye, such as fluorescein, rhodamine 6G
CC   or Texas Red, was covalently linked to the 3'-amino group. A
CC   monomaleimido-gold nanoparticle was then covalently linked to the 5'
CC   sulfhydryl group to form the molecular beacon. In the native state with
CC   hybridised termini, the proximity of the fluorophore and quencher (gold
CC   nanoparticle) in the molecular beacon is such that little or no
CC   fluorescence is detectable. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence (e.g. the
CC   sequence in ABL57070 or ABL57071), the hairpin undergoes a conformational
CC   change resulting in an increase in fluorescence, the extent of which is
CC   proportional to the amount of binding partner present. Single mismatch
CC   detection was demonstrated. The invention relates generally to the use of
CC   metal surface quenchers such as particles or films for high sensitivity
CC   applications in, for example, detection and diagnostic systems

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5552; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   New array of nucleic acid probes, useful for in situ hybridization, in
PT   Southern, Northern or dot-blot hybridization to identify or detect the
PT   sequence or specific mutations of any gene.
XX
PS   Claim 1; SEQ ID NO 83918; 9pp; English.
XX
CC   The invention discloses a microarray comprising a plurality of nucleic
CC   acid probes including one of 2,018,500 fully defined sequences, or its
CC   perfect match, perfect mismatch, antisense match or antisense mismatch.
CC   Also disclosed is a method of gene expression analysis. The array is used
CC   in monitoring gene expression levels by hybridisation to a DNA library,
CC   in analysis of genetic variation or in hybridisation of tag-labelled
CC   compounds. The nucleic acid probes are specifically designed for analysis
CC   of at least one target sequence. The method of analysis comprises
CC   hybridising at least one or more nucleic acids to at least two or more
CC   nucleic acid probes and detecting the hybridisation. The nucleic acid
CC   probes are attached to a solid support. The analysis comprises monitoring
CC   gene expression levels, identifying biallelic markers or polymorphisms,
CC   or family members of a gene and a cross-species comparison. Each of the
CC   nucleic acids further comprises a tag sequence. The array of nucleic acid
CC   probes is useful in in situ hybridisation, in Southern, Northern or dot-
CC   blot hybridisation to identify or detect the sequence or specific
CC   mutations of any gene, in mapping the 5' termini of mRNA molecules by
CC   primer extensions or in screening cDNA or genomic libraries or subclones
CC   for additional subclones containing segments of DNA that have been
CC   isolated and previously sequenced. The sequence presented is one of the
CC   nucleic acid probes incorporated in the microarray. Note: The sequence
CC   data for this patent can also be obtained in electronic format directly
CC   from USPTO at seqdata.uspto.goc/sequence.html

PT   Hairpin sensor useful for detecting a target nucleotide sequence in a
PT   sample, comprises a hairpin loop assembly including a complementary probe
PT   and a quenchable fluorescing agent.
XX
PS   Example 2; Page 11; 16pp; English.
XX
CC   The invention discloses a hairpin sensor comprising a hairpin loop
CC   assembly including a complementary probe positioned between a first
CC   inverse repeat arm and a second inverse repeat arm, and a quenchable
CC   fluorescing agent joined, directly or indirectly, to the end of the
CC   second inverse repeat arm of the hairpin loop assembly opposite the
CC   complementary probe. Also claimed is a microarray comprising the hairpin
```

```
CC   sensor, where the end of the first inverse repeat arm opposite the
CC   complementary probe is bound, directly or indirectly, to a support, a kit
CC   for detecting a target nucleotide sequence in a sample comprising the
CC   hairpin sensor, and a support, and a hairpin sensor system, in which the
CC   particle is conductive or semi-conductive, including at least one of the
CC   above hairpin sensor assemblies. The hairpin sensor further comprises a
CC   functional group joined to the end of the first inverse repeat arm
CC   opposite the complementary probe, or first spacer opposite the first
CC   inverse repeat arm, the functional group selected from amino, carboxyl,
CC   thiol and hydroxyl. Further, the sensor comprises a ligand positioned
CC   between the second inverse repeat arm and the quenchable fluorescing
CC   agent, where the ligand is selected from mercapto, hydroxyl, amino,
CC   nitrile and carboxyl, carboxylic acid, organic acid and amino acid. The
CC   second spacer is positioned between the second inverse repeat arm and the
CC   quenchable fluorescing agent which comprises a semiconductor nanocrystal
CC   or rhodamine B-labelled dye. Within the microarray the support is capable
CC   of accepting a charge. At least one hairpin sensor comprises two or more
CC   hairpin sensors. The two or more hairpin sensors include complementary
CC   probes that are the same or different and respective quenchable
CC   fluorescing agents that are the same or different. The two or more
CC   hairpin sensors are arranged in a spatially-defined pattern. The sensor
CC   and system are useful for detecting a target nucleotide sequence in a
CC   sample. Further, the method involves identifying the target nucleotide
CC   sequence by the location of the complementary probe to which the target
CC   nucleotide sequence binds. The two or more hairpin sensors include
CC   complementary probes or quenchable fluorescing agents, that are
CC   different. The sequence presented is the hairpin oligonucleotide, #1,
CC   used in an example of the invention.

PT   Quantifying in vivo RNA from a biological sample for producing a
PT   medicament for treating immune related disease by determining in vivo
PT   levels of transcripts using nucleic acid/reverse transcription-PCR
PT   reagent mix in an automated setup.
XX
PS   Disclosure; Page 42; 83pp; English.
XX
CC   The present invention relates to a method of quantifying in vivo RNA from
CC   a biological sample. This involves collecting the biological sample in a
CC   tube comprising a compound inhibiting RNA degradation and/or gene
CC   induction, forming a precipitate comprising nucleic acids, separating the
CC   precipitate from the supernatant, dissolving the precipitate using a
CC   buffer, forming a suspension, isolating nucleic acids from the suspension
CC   using an automated device, dispersing or distributing a reagent mix for
CC   reverse transcription (RT)-PCR using an automated device, dispersing or
CC   distributing the nucleic acids isolated within the dispersed reagent mix
CC   using an automated device and determining the in vivo levels of
CC   transcripts using the nucleic acid and RT-PCR reagent mix of the previous
CC   step in an automated setup. The method is useful for monitoring or
CC   detecting changes in in vivo nucleic acids levels in a biological agent
CC   present, such as eukaryotic or prokaryotic cells, viruses or phages in a
CC   biological sample or for producing a medicament for treating immune
CC   related disease, e.g., autoimmunity, rheumatoid arthritis, multiple
CC   sclerosis, cancer, immunodeficiencies such as AIDS, allergy, graft
CC   rejection or Graft versus Host Disease. The present sequence is a PCR
CC   primer/probe used in the exemplification of the invention

PT   New phospho:di:esteric oligo:nucleotide(s) - which exert a specific and
PT   selective cytotoxic effect on tumour cells, for treating both solid and
PT   liquid tumours.
XX
PS   Claim 10; Page 5; 38pp; English.
XX
CC   Novel phosphodiesteric oligonucleotides AAT93811-27 are based on the
CC   generic formula, in the 3'-5' or 5'-3' direction: (GaTa')a''-(GbTb')b''-
CC   (GcTc')c''-(GdTd')d''-(GeTe')e''-(GfTf')f''- (G-gTg')g''-N', where: N and
CC   N' = T or G, equal or different from each other; x = 0-8, equal or
CC   different from each other; a, b, c, d, e, f, and g = 0-10, equal or
CC   different from each other; a', b', c', d', e', f', and g' = 0-30, equal
CC   or different from each other; a'', b'', c'', d'', e'', f'', and g'' = 1-
CC   16, equal or different from each other; The oligonucleotides are believed
CC   to selectively bind and sequester some proteins which are essential to
CC   the viability and growth of tumoural cell line. They have specific and
CC   selective cytotoxic activity against tumour cells, and can be used for
CC   treating tumours of the liquid type, in particular of lymphoblastic
CC   origin, and of solid type, in particular lymphomas. The present
CC   phosphodiester oligonucleotide, at a concentration of 15 micromolar,
CC   reduced growth of CCRF-CEM tumoural cells by 76%, which is detectable 48
CC   hours after administration. (Updated on 25-MAR-2003 to correct PR field.)

PT   New compositions comprising sensor arrays made up of unique probe
PT   oligonucleotides - useful for characterizing a sample of target deletion
PT   oligonucleotides.
XX
PS   Example 1; Page 96; 163pp; English.
XX
CC   This invention describes a novel composition comprising a number of
CC   sensor arrays, where each array comprises a unique probe oligonucleotide,
CC   which is the reverse complement of part of a unique target
CC   oligonucleotide present in a mixture of target deletion sequence
CC   oligonucleotides. The compositions form a method for characterizing a
CC   sample of target deletion oligonucleotides which are labelled and
CC   hybridize with the probe oligonucleotides of the sensor arrays. Such
CC   oligonucleotides and their targets are represented in AAX23548-X23709.
CC   Oligonucleotides characterized by the method form pharmaceutical
CC   compositions that are useful for modulating cellular adhesion or
CC   proliferation, and being active against a eukaryotic pathogen, a human
CC   retrovirus, a human immunodeficiency virus (HIV), or a non-human
CC   retrovirus, including influenza virus, Epstein-Barr virus, Respiratory
CC   Syncytial Virus or cytomegalovirus (CMV). The compositions enable
CC   characterization of deletion sequence oligonucleotides having related,
CC   but different nucleobase sequences, and quantification of different
CC   species of deletion sequence ("target") oligonucleotides in a mixture.
CC   Also, if the specificity of the oligonucleotide's nucleobase sequence for
CC   its reverse complement is not modified, the method may be performed using
CC   oligodeoxynucleotides

PT   New immunostimulatory compositions comprising RNA/DNA hybrid
PT   oligonucleotides, useful for enhancing an immune response or inducing
PT   cytokines, particularly for treating diseases, e.g. cancer, allergy or
PT   HIV infection.
XX
PS   Example 1; Page 30; 68pp; English.
XX
CC   The present invention relates to an immunostimulatory composition, which
CC   comprises at least one oligonucleotide comprising both an RNA region and
CC   a DNA region. The composition is useful for enhancing an immune response
CC   or inducing cytokines. It can be used as a vaccine adjuvant and in
CC   treating diseases, including pathogenic infection, (non-)malignant
CC   tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or
CC   colon, or carcinomas and sarcomas), autoimmune diseases or allergies
CC   (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease,
CC   hepatitis, HIV or malaria. The composition is also useful for treating,
CC   preventing or ameliorating the symptoms resulting from exposure to a bio-
CC   warfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is
CC   an immunostimulatory oligonucleotide described in the exemplification of
CC   the invention

PT Identifying target genes for allele-specific drugs - used for diagnosis,
PT prevention and treatment of, e.g. cancers, atherosclerotic plaque,
PT dysplastic lesions, endometriosis or graft versus host disease.
XX
PS Disclosure; Fig 7; 605pp; English.
XX
CC This invention describes a novel method for identifying an inhibitor
CC potentially useful for treatment of cancer, where the inhibitor is active
CC on a gene vital for cell growth or viability, and where the gene is
CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is
CC used for preventing the development of cancer in a patient having a

CC precancerous condition, by administering to the patient a first allele
CC specific inhibitor (ASI) targeted to an allele of a first essential gene
CC present in cells of the precancerous condition, where the normal somatic
CC cells of the patient are heterozygous for the first gene, the inhibitor
CC is active on at least one but less than all allelic forms of the gene
CC present in a population and targets only one allelic form present in the
CC normal somatic cells, and the first gene. The products and methods can be
CC used in the diagnosis, prevention and treatment of LOH disorders, e.g.
CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic
CC lesions, benign tumours, endometriosis, polycystic kidney disease, and
CC graft versus host disease. The method can also be used to remove
CC malignant cells from bone marrow transplants. AAZ25812-Z26825 represent
CC human polymorphic sites described in the method of the invention

PT Analysis of DNA fragment - comprises addition of known common
PT oligonucleotide, amplification of resultant DNA fragment and analysis and
PT labelling of amplified DNA.
XX
PS Example 1; Page 12; 17pp; Japanese.
XX
CC This invention descibes a novel method for the analysis of a DNA fragment
CC which comprises: (i) addition of a known common oligonucleotide sequence
CC to at least one terminal of each DNA fragment, (ii) amplification of the
CC resultant DNA fragment as a primer using a first common primer containing
CC a complementary nucleotide sequence to the above mentioned known common
CC oligonucleotide sequence, a second common primer containing a
CC complementary nucleotide sequence to the prepared known common
CC oligonucleotide sequence optionally having been introduced with
CC complementary nucleotide sequence at a terminal, and a specific primer
CC capable of hybridisation with a DNA fragment containing whole or part of
CC the gene having known sequence, to give amplified DNA, (iii) analysis of
CC the amplified DNA to find the information of the DNA fragment, in which
CC the specific primer is designed to prepare fragments of the common first
CC and second primers and to give short fragment of amplified DNA and (iv)
CC labelling them to make their differentiation. Differentiation of
CC informations of known and unknown genes readily provides information of
CC unknown gene and simultaneous monitoring of signals derived from minor
CC genes. Furthermore, labelling of DNAs according to functions of known
CC genes can be performed. AAZ09189-Z09201 represent oligonucleotide primers
CC used to illustrate the method of the invention

PT   Diagnosing or detecting a predisposition to a disease or disorder in
PT   vitro for treating asthma and HIV infection involves examining the
PT   presence of genetic polymorphism in RANTES gene promoter.
XX
PS   Claim 12; Page 40; 58pp; English.
XX
CC   The present invention relates to a method for detecting or diagnosing a
CC   predisposition to a disease or disorder associated with abnormal RANTES
CC   gene expression in vitro. The method involves examining the RANTES gene
CC   promoter to detect the presence of a genetic polymorphism. Also included
CC   in the invention is a method of treating individuals who either have or
CC   are pre-disposed to diseases or disorders associated with abnormal RANTES
CC   gene expression by administering to individuals who have a RANTES
CC   promoter polymorphism as determined by the method, a modulator of RANTES
CC   activity. RANTES (regulated upon activation normal T cell expressed and
CC   secreted) belongs to the superfamily of pro-inflammatory cytokines called
CC   chemokines. RANTES is involved in the attraction and recruitment of
CC   monocytes, memory T cells, basophils, and natural killer cells to sites
CC   of inflammation. The RANTES gene is located on the long arm of chromosome
CC   17 at 17Q 11.2-q12. The method is useful for diagnosing and detecting
CC   inflammatory diseases, asthma and HIV infection and also for diagnosing
CC   patients having a predisposition to develop these diseases. Modulators of
CC   RANTES activity are useful for treating individuals who either have or
CC   are predisposed to diseases or disorders associated with abnormal RANTES
CC   gene expression such as asthma, and HIV, and other inflammatory diseases.
CC   This sequence represents a PCR primer used to amplify a fragment of the
CC   human RANTES promoter sequence. The fragment of DNA amplified, contains
CC   the area surrounding a single nucleotide polymorphism (SNP) at position -
CC   403. The primer is used in the method of the invention

PT   Identifying a candidate polymorphic repeat within a coding sequence, for
PT   understanding or treating genetic disease, comprises detecting tandem
PT   repeats in a target coding sequence and scoring the repeats for
PT   polymorphic probability.
XX
PS   Example; Col 273; 588pp; English.
XX
CC   The invention discloses a method for identifying a candidate polymorphic
CC   repeat within a coding sequence (expressed sequence tag, EST), which
CC   comprises detecting tandem repeats in a target coding sequence, scoring
CC   the repeats for polymorphic probability and generating a dataset
CC   correlating the repeats with polymorphic probability to identify a
CC   candidate polymorphic repeat. The computational methods (polymorphic
CC   marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are
CC   useful for identifying and detecting candidate polymorphic repeats in
CC   human genes, which can be used to understand, treat or eliminate genetic
CC   diseases, predispositions or adverse drug-treatment reactions. Examples
CC   of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
CC   syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis,
CC   myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and
CC   spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are
CC   the polymorphic repeats identified for a search of human ESTs

PT   Novel human prostate cancer predisposing gene in which somatic and
PT   germline mutations correlate with prostate cancer, useful in gene therapy
PT   and for diagnosis and prognosis of predisposition to prostate cancer.
XX
PS   Example 8; Page 72; 159pp; English.
XX
CC   The present invention describes a human prostate cancer susceptibility
CC   gene, designated the human prostate cancer predisposing gene 1 (HPC1).
CC   AAA26459 to AAA26510 represent nucleotide sequences from the HPC1 gene.
CC   The HPC1 gene sequences are used as diagnostic molecules since they can
CC   determine a predisposition to cancers especially, prostate cancer.
CC   Nucleic acid probes from the present invention are used to detect
CC   mismatches of the HPC1 gene or mRNA. Primers from the present invention
CC   can be used for determining the nucleotide sequence of a particular HPC1
CC   allele. The mutations in the HPC1 allele which lead to an altered
CC   function of HPC1 are used in diagnostic and prognostic methods to
CC   determine a predisposition to cancer. HPC1 genes are also used in gene
CC   therapy to treat cancer. The HPC1 gene can be found in the HPC1 region of
CC   human chromosome 1, bound by the markers mM.GAAA.158;23.4 and
CC   mM.GA57e15.S16. AAA26513 to AAA26521 represent oligonucleotides used in
CC   hybrid selection in an example from the present invention. AAA26522 to
CC   AAA26537 represent PCR primers for the HPC1 gene, and AAA26538 to
CC   AAA26658 represent PCR primers used in mutation screening of the HPC1
CC   gene. AAA26659 to AAA26662 encode the putative protein sequences given in
CC   AAY82362 to AAY82365 from HPC1

PT   DNA encoding Human corticotropin releasing hormone receptor-related G
PT   protein-coupled receptor - useful for studies and possibly treatment of
PT   stress related illnesses.
XX
PS   Example; Page 6; 13pp; English.
XX
CC   The present sequence is a degenerate PCR primer, for the cDNA mol. which
CC   encodes human corticotropin releasing hormone (CRH) related G-protein
CC   coupled receptor. The cDNA was derived from a human brain and skeletal
CC   muscle poly(A)+ RNA, using Superscript II MLV reverse transcriptase
CC   (BRL), and oligo d(T) 12-18 as the primer. Transgenic animals, which
CC   express the CRH receptor, can be produced by inserting the cDNA into the
CC   embryonic stem cells of mice, or other mammals. The CRH receptor can be
CC   used to identify agonists and antagonists, and in the development of
CC   therapeutic cpds. for the treatment of, e.g. anorexia nervosa, irritable
CC   bowel syndrome, HIV or Alzheimer's disease. Anti-CRH receptor antibodies
CC   can be used in vaccine prepns., and oligonucleotides antisense to the
CC   cDNA can be used to modulate its expression

PT   Novel leukemia related protein 24.09.
XX
PS   Example 3; Page 17 (disclosure); 32pp; Chinese.
XX
CC   This invention relates to the DNA and protein sequences of leukemia
CC   related protein 24.09. The invention also comprises methods for producing
CC   the protein using recombinant DNA technology and antagonists of the
CC   protein which may be used for inhibiting the action of the protein. The
CC   sequences of the invention may be used for treating several diseases such
CC   as leukaemia, lymphoma, other haemopathy and growth development
CC   disturbance disease. The present sequence represents a reverse
CC   transcription (RT) PCR primer used to isolate the leukaemia related
CC   protein cDNA 24.09 of the invention

PT   Selection of specific protein by screening protein-RNA fusions generated
PT   in vitro or in situ - useful for, e.g. identifying enzymes and antibodies
PT   with altered properties, potentially useful as catalysts or for therapy
PT   or diagnosis.
XX
PS   Disclosure; Page 39; 94pp; English.
XX
CC   The Oligonucleotides AAV48087, AAV48089-V48091 and AAV48096-V48098 and
CC   variations were used to generate RNA-protein fusions. These were used in
CC   the selection of a specific protein or RNA, by in vitro or in situ
CC   translation of candidate RNA molecules to produce RNA-protein fusions,
CC   then selecting specific RNA protein fusions. The method is used to select
CC   proteins (or DNA encoding them) having altered properties, e.g. for
CC   identification of new binding reagents, to identify improved human
CC   antibodies or new enzymes. These proteins are potentially useful in
CC   diagnosis and therapy, or as industrial catalysts. The methods allow many
CC   rounds of selection and amplification to be performed, resulting in
CC   enrichment of even very rare molecules and allowing isolation of proteins
CC   that bind specifically to almost any compound or catalyse almost any
CC   reaction

PT   New transgenic mouse, useful for modeling lysosomal disorders and testing
PT   cell- or tissue-specific targeting systems.
XX
PS   Example 3; Page 12; 20pp; English.
XX
CC   The present invention describes a mouse (I), homozygous for a disruption
CC   in the alpha-L-iduronidase (IDUA) gene but with normal expression of the
CC   hepatic sulphate transporter SAT-1 gene. (I) is used to evaluate
CC   therapeutic agents for use in treating mucopolysaccharidosis Type I (MPS
CC   I) by administering the agent to (I) and evaluating the mouse for
CC   pathology associated with iduronidase deficiency. (I) may also be used to
CC   evaluate the ability of a targeting system to deliver a therapeutic agent
CC   to a specific tissue or organ in the mouse using the same techniques.
CC   Targeting systems which may be tested using this regime include a target-
CC   specific label, a viral expression vector or a liposome coupled to
CC   iduronidase. (I) may also be used as a general model for studying the
CC   pathology of MPS I. The SAT-1 gene overlaps with the IDUA gene but in (I)
CC   the expression of the SAT-1 gene is unaffected. Therefore any
CC   pathological effects observed in (I) are due solely to the disruption of
CC   the IDUA gene. The present sequence represents a IDUA genomic DNA
CC   oligonucleotide used in the exemplification of the present invention

PT   Polynucleotides comprising single nucleotide polymorphisms in the human
PT   dopamine receptor D2, useful for detecting mutations associated with,
PT   e.g. schizophrenia, Parkinson's and myoclonus dystonia.
```

```
XX
PS   Example 1A; Page 37; 135pp; English.
XX
CC   The present invention describes polynucleotides comprising single
CC   nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2).
CC   The polynucleotides may be used in assays to detect and characterise
CC   polymorphisms in DRD2 that affect its expression and activity and are
CC   involved in disorders such as schizophrenia, Parkinson's and myoclonus
CC   dystonia (MD). This information would be useful for studying the
CC   biological function of DRD2 as well as in identifying drugs targeting
CC   this protein for the treatment of disorders related to its abnormal
CC   expression or function. Polymorphisms in the DRD2 gene affect the
CC   expression of active and functional polypeptides. Therefore it is
CC   advantageous to detect polymorphisms in the DRD2 gene and how those
CC   polymorphisms are combined in different copies of the gene. AAF70261 to
CC   AAF70308 represent human DRD2 allele specific oligonucleotide probes, and
CC   AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide
CC   primers which are used in the detection of DRD2 polymorphisms. AAF70405
CC   to AAF70452 represent oligonucleotide primers for the detection of human
CC   DRD2 polymorphisms which are given in the exemplification of the present
CC   invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2
CC   gene which are used in examples from the present invention

XX
CC   The present invention discloses a new polypeptide-human zinc finger
CC   protein 41.58, a polynucleotide encoding the polypeptide and producing
CC   the polypeptide by using DNA recombination technology. The polypeptide is
CC   useful for curing several diseases, such as solid tumour, nervous system
CC   disease, malignant disease of blood, development disturbance and human
CC   immunodeficiency virus (HIV) infection by using the polypeptide. The
CC   invention also discloses an antagonist for resisting the polypeptide and
CC   its therapeutic action, and also discloses application of a
CC   polynucleotide encoding the new human zinc finger protein 41.58. This
CC   sequence represents a reverse transcriptase PCR primer used to isolate
CC   DNA encoding the novel human zinc finger protein 41.58

PT Producing sub-population of labeled nucleic acids, useful for analyzing
PT differences in RNA profiles between several different physiological
PT sources, using set of distinct gene specific primers.
XX
PS Example 3; SEQ ID NO 1299; 11pp; English.
XX
CC The invention relates to producing a sub-population of labeled nucleic
CC acids (NAs) comprising contacting a NA sample from a physiological
CC source, with a pool of 50 distinct gene specific primers under suitable
CC conditions to enzymatically generate sub-population of NAs, where each
CC gene specific primer has a sequence complementary to a distinct mRNA, and
CC each labeled NA is generated using a single gene specific primer. The
CC method is useful for producing a sub-population of labeled NAs which is
CC useful for analysing the differences in the RNA profiles between several
CC different physiological sources, where the method comprises producing
CC subpopulation of labeled NAs for the different physiological sources,
CC comprising the populations for each physiological source to identify
CC differences in the population, where the comparison is preferably
CC performed by hybridising the labeled NAs for each of the distinct
CC physiological sources to an array of probe NAs stably associated with the
CC surface of a substrate to produce a hybridisation pattern for each of the
CC sources, and comparing the patterns for each of the sources, where
CC differential gene expression assays are utilised in differential
CC expression analysis of diseased a normal tissue e.g. neoplastic a normal
CC tissue, or different tissue or subtissue types. The present sequence is a
CC human gene specific PCR primer used in the method of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from USPTO
CC at http.wipo.seqdata.uspto.gov/sequence.html?DocID=6352829B1

PT A human Hsmar1 polypeptide 15.95, useful for curing e.g. tumors and
PT diabetes.
XX
PS Example 3; Page 19 (Disclosure); 32pp; Chinese.
XX
CC The invention relates to human marinerl transposase (Hsmarl) protein
CC 15.95 (ABB09530) and nucleic acids encoding it (ABQ77629). The protein
CC has a molecular weight of 15.95 kD and has 84% identity and 91% homology
CC over a 145 amino acid stretch with human marinerl transposase given in
CC GenBank accession number U52077. The invention also relates to a method
CC for the recombinant production of the protein, an antagonist of the
CC protein, and the use of the protein, gene and antagonist in therapeutic
CC applications. Hsmarl protein 15.95 can be used in the treatment of a
CC variety of diseases such as embryonic development disorders, tumours,
CC diabetes, menstrual disorders, peptic ulcers, arrhythmia, anaemia and
CC epilepsy. The present sequence represents cDNA encoding human Hsmarl
CC protein 15.95. Sequences ABQ77630-ABQ77631 represent reverse
CC transcription-PCR (RT-PCR) primers used in an exemplification of the
CC invention to isolate human Hsmarl protein 15.95 cDNA

PT Detecting mutations in nucleic acid, useful e.g. for diagnosing
PT hemochromatosis, by solid phase amplification to incorporate exonuclease
PT resistant nucleotide.
XX
PS Example 3; Fig 3; 43pp; French.
XX
CC PCR primers ABL56411-12 and probe ABL56413 were used to detect a mutation
CC responsible for cystic fibrosis. The primers and probe are used to
CC demonstrate the method of the invention. The specification describes a
CC method for detecting a mutation at position n in a target nucleic acid by
CC solid phase amplification process. The region of interest is amplified on
CC at least two separate supports (A, B) using at least one primer linked,
CC at its 5'-end, to the supports. The DNA strands are then separated and
CC strands in the suspension removed by washing. Bound DNA sequences are
CC hybridized to a probe, the 3'-end of which hybridizes up to, at most,
CC position n-1. The probe is elongated by adding complementary nucleotides
CC in the 5' to 3' direction, using a DNA polymerase and a nucleotide
CC derivative (dNTP*) that is resistant to exonuclease. The dNTP* used is
CC complementary to the mutation for support A but to the wild type for
CC support B. Products are digested with an exonuclease so that only probes
CC elongated by dNTP* are not degraded. The supports are then washed and non
CC -degraded probes detected (in)directly. The method is used to detect
CC mutations associated with disease, especially haemochromatosis; sickle-
CC cell anaemia; alpha or beta-thalassemia; cystic fibrosis; haemophilia;
CC neurodegeneration and cancer. The method is also used to study
CC polymorphisms of gene or an entire genetic region and for detecting
CC and/or identifying genetically modified organisms

PT   New isolated NOVX polypeptides and nucleic acid molecules useful for
PT   treating, preventing and diagnosing pathological conditions with NOVX-
PT   associated disorders, such as cancer, obesity, diabetes and inflammatory
PT   or CNS diseases.
XX
PS   Example B; SEQ ID NO 379; 772pp; English.
XX
CC   The invention relates to novel isolated polypeptides, mature form of the
CC   polypeptide, a sequence that is 95% identical to the polypeptide or the
CC   polypeptide comprising one or more conservative substitutions. The NOVX
CC   polypeptide is useful for treating or preventing a pathology associated
CC   with the polypeptide e.g. disorders associated with aberrant expression
CC   or activity of the polypeptide, such as cancer, diabetes, obesity, and
CC   endocrine, CNS and inflammatory disorders. They can also be used in
CC   various detection and screening assays, chromosome mapping, tissue typing
CC   and predictive medicine. This sequence corresponds to a primer used to
CC   amplify and isolate the coding sequence for one of the polypeptides of
CC   the invention.

PT   Cytochrome P450 monooxygenase of the cyanogenic glycoside pathway -
PT   useful for the production of plants with improved nutritive value or pest
PT   resistance.
XX
PS   Example 5; Page 29; 32pp; English.
XX
CC   The present sequence represents a PCR primer for cytochrome P450
CC   monooxygenase from Sorghum bicolor (L.) Moench, designated P450ox.
CC   Cytochrome P450 monooxygenase catalyses: (i) the conversion of aldoxime
CC   to a nitrile; and (ii) the nitrile to the corresponding cyanohydrin. DNA
CC   encoding cytochrome P450 monooxygenase can be used to obtain transgenic
CC   plants, for the purpose of improving the nutritive value or pest
CC   resistance of the plant. Cytochrome P450 monooxygenase catalyses the
CC   conversion of aldoximes to nitriles to cyanohydrins, which are the
CC   precursors of toxic cyanogenic glycosides, so staple food such as cassava
CC   and lima beans, as well as animal feed such as white clover, can be
CC   rendered less toxic by blocking the cytochrome P450 monooxygenase
CC   activity. Introducing the enzyme to plants or to certain tissues could
CC   help reduce crop damage since the product is also toxic to insects,
CC   acarids and nematodes

PT   New genotyping oligonucleotide, useful for detecting the presence,
PT   absence or identity of single polynucleotide polymorphism in a nucleic
```

PT acid sample.
XX
PS Claim 1; Page 54; 83pp; English.
XX
CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
CC primer extension (SNPE) primers, and the sequences of regions flanking
CC sites of single nucleotide polymorphisms SNPs. The present invention
CC includes kits for determining the presence or absence of a SNP, using the
CC oligonucleotides of the invention. The PCR primers are used to amplify a
CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.
CC The oligonucleotides are useful for genotyping a nucleic acid sample by
CC performing a single-nucleotide primer extension reaction. The
CC oligonucleotides are useful for determining the presence, absence or
CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
CC assess by association analysis the genotype of an individual or group of
CC individuals, having a pathological phenotypic trait suspected of being
CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
CC traits also include symptoms of or susceptibility to multifactorial
CC disease of which a component is or may be genetic such as autoimmune
CC diseases, including, rheumatoid arthritis, multiple sclerosis,
CC inflammation, cancer, nervous system diseases and infection by pathogenic
CC microorganism. The method is also useful in forensic investigations and
CC paternity analysis. The present sequence represents a single nucleotide
CC primer extension (SNPE) primer specific for a human SNP containing DNA
CC sequence

PT   Methods and polynucleotide(s) for diagnosing hyperhomocysteinaemia -
PT   and/or predisposition to develop premature atherosclerosis by detecting
PT   increased levels of serum homocysteine.
XX
PS   Disclosure; Page 22; 84pp; English.
XX
CC   Arbitrary RT-PCR primers (AAT75138-42) were used to amplify mRNA from
CC   cells exposed to hyperphysiological, normal or subphysiological levels of
CC   homocysteine. PCR products were separated on a sequencing gel and
CC   discrete fractions which were increased or decreased were identified.
CC   This method was used to identify mRNA and the corresponding cDNA which
CC   are increased in the cells of a patient having hyperhomocysteinaemia or a
CC   predisposition to homocysteine mediated atherosclerosis. These
CC   polynucleotides can be used for the diagnosis and treatment of
CC   atherosclerotic diseases and diseases of metabolism of sulphur containing
CC   amino acids (e.g. homocysteinaemia), which are associated with vascular
CC   damage and atherosclerotic disease, specifically unstable angina, acute
CC   myocardial infarction (heart attack), cerebrovascular accidents (stroke),
CC   hypertension, renal artery stenosis, aortic stenosis and deep vein
CC   occlusive disease

PT   New pituitary tumour transforming gene and protein - used for diagnosis,
PT   monitoring and treatment of tumours.
XX
PS   Example 1; Page 23; 44pp; English.
XX
CC   The primers AAV36965 and AAV36966 were used in the isolation of the
CC   pituitary-tumour transforming gene (PTTG). The PTTG encodes a polypeptide
CC   that is expressed by pituitary tumour cells and binds to anti-PTTG
CC   antibodies (Ab). Recombinant PTTG is useful as an immunogen for raising
CC   Ab, in assays and for therapy. Ab, optionally labelled, are used to
CC   detect, e.g. for monitoring treatment or in in vivo imaging, or purify
CC   human PTTG, e.g. for diagnosis of pituitary tumours and for
CC   differentiating between malignant and benign tumours in biopsy samples.
CC   Oligonucleotides and antisense oligonucleotides can also be used
CC   therapeutically to counteract or stimulate biological effects of PTTG.
CC   Many cancers express PTTG, and the nucleic acid sequence can transform
CC   cells without a complementary oncogene; it is responsible for tumour
CC   formation in the pituitary. PTTG is useful in gene replacement therapy
CC   and transgenic animals are used as models for studying pituitary tumours

PT   New gene encoding a beacon protein associated with modulation of obesity,
PT   diabetes and metabolic energy levels.
XX
PS   Example 5; Page 51; 85pp; English.
XX
CC   This invention describes a novel beacon protein and its encoding nucleic
CC   acid which is expressed in larger amounts in hypothalamus tissue of obese
CC   animals compared to lean animals. Agonists and antagonists of beacon can
CC   be used to treat obesity, anorexia, weight maintenance, energy imbalance,
CC   diabetes, metabolic syndrome, dyslipidemia, hypertension and/or insulin
CC   resistance. The beacon protein, itself is used to manufacture medicaments
CC   for treatment of obesity, anorexia, energy imbalance or diabetes. The
CC   treatment is contemplated for both human and animals, such as those
CC   important to the livestock industry. The antibody and polynucleotides are
CC   useful in diagnosis of conditions as above. This sequence represents a
CC   PCR primer used in the method of the invention

PT   Newly isolated nucleic acid molecule (designated p23) encoding a p23
PT   polypeptide - useful for inducing a senescence phenotype in a cell.
XX
PS   Example 1; Page 18; 44pp; English.
XX
CC   The present invention describes human senescence factor p23. An
CC   expression vector for p23 is useful for inducing a senescent phenotype in
CC   a cell (preferably eukaryotic). This may help in regulating diseases,
CC   including cancer, persistent inflammation, and various proliferative and
CC   degenerative disorders. These transgenic cells are useful in gene therapy
CC   for treating cancer, particularly where antisense oligonucleotides are
CC   useful for blocking normal or mutant p23 expression in cancer cells or
CC   other proliferating cells. Transgenic cells are also useful for producing
CC   the p23 polypeptide in large quantities. The antibodies are useful for
CC   raising antiserum against p23, and for identifying senescent cells in
CC   culture and tissue biopsies. The p23 polynucleotides are useful for
CC   modulating or altering p23 activity in a cell, and for identifying and
CC   isolating the whole gene encoding p23, and variants of p23. Assays based
CC   on p23 elements, which detect p23 levels and activity are useful as
CC   diagnostic markers for staging tumours, determining prognosis, and/or
CC   predicting therapeutic success. These elements also provide an assay for
CC   detecting chromosomal rearrangements in chromosome 3 in a human cell. The
CC   isolation of the p23 polynucleotide permits the manipulation of malignant
CC   growth in cancer. The present sequence represents a primer used in an
CC   example from the present invention

PT Peptides having at least two new nucleotides - useful as primers in RT-
PT PCR.
XX
PS Disclosure; Page 10; 19pp; Japanese.
XX
CC This sequence represents a primer of the invention. The invention relates
CC to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC natural number indicating the repetition of alpha; beta, delta = V or N;
CC V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC repetition of gamma, in which thymine expressed by gamma is composed of
CC 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC useful as primers for RT-PCR and determination of base sequences. The new
CC sequences allow for reproductive and highly efficient analysis of gene
CC sequences

CC The sequence is that of the 3' end of a sequence encoding a secreted
CC protein from a human fetal kidney clone AK296. Such a sequence is
CC predicted to have biological activities which would make them suitable
CC for treating, preventing or ameliorating medical conditions in humans and
CC animals, although no supporting data is given. Suggested activities
CC include nutritional activity, cytokine and cell
CC proliferation/differentiation activity, immune stimulating (e.g. as
CC vaccines) or suppressing activity, haematopoiesis regulating activity,
CC tissue growth activity, activin/inhibin activity,
CC chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,
CC receptor/ligand activity, anti-inflammatory activity, cadherin/tumour
CC invasion suppressor activity, and tumour inhibition activity. It is also
CC stated to be useful for gene therapy

XX
CC The sequence is that of the 3' end of a sequence encoding a secreted
CC protein from a human fetal kidney clone AK296. Such a sequence is
CC predicted to have biological activities which would make them suitable

```
CC   for treating, preventing or ameliorating medical conditions in humans and
CC   animals, although no supporting data is given. Suggested activities
CC   include nutritional activity, cytokine and cell
CC   proliferation/differentiation activity, immune stimulating (e.g. as
CC   vaccines) or suppressing activity, haematopoiesis regulating activity,
CC   tissue growth activity, activin/inhibin activity,
CC   chemotactic/chemokinetic activity, haemostatic and thrombolytic activity,
CC   receptor/ligand activity, anti-inflammatory activity, cadherin/tumour
CC   invasion suppressor activity, and tumour inhibition activity. It is also
CC   stated to be useful for gene therapy

PT   New nucleoside derivatives with photolabile protecting groups, useful in
PT   oligonucleotide synthesis, particularly on solid phases, e.g. for
PT   hybridization testing.
XX
PS   Disclosure; Fig 9; 48pp; German.
XX
CC   This invention describes nucleoside derivatives (I) with photolabile
CC   protecting groups. (I) are used to synthesize oligonucleotides using the
CC   photolithographic nucleic acid chip method, particularly where these are
CC   intended for performing enzymatic reactions initiated from a free 3'-
CC   hydroxy (especially solid-phase polymerase reactions or ligase reactions,
CC   but also reverse transcription, cDNA synthesis etc.), also for
CC   hybridization testing, sequencing and in DNA computing. (I) are produced
CC   with high selectivity by reaction with a mild acylating agent that has
CC   high specificity for the 3'-position, without significant side-reactions
CC   (cf. more reactive acylating agents such as chloroformates)

PT New nucleic acid encoding a human LIM mineralization protein for inducing
PT or inhibiting bone formation, fusing a spine, stimulating production of
PT an osteogenic cell, or treating bone conditions, such as, osteoporosis.
XX
PS Example 9; Page 61; 84pp; English.
XX
CC The present invention specifically describes the human LIM mineralisation
CC proteins (LMP) HLMP-2 and HLMP-3. LMPs have osteopathic activity and can
CC be used in gene therapy. LMP nucleic acids can be used to induce or
CC inhibit bone formation, fuse a spine, stimulate production of an
CC osteogenic cell, or inhibit the expression of HLMP-2 or HLMP-3. They can
CC be used to treat bone conditions, such as, osteoporosis and other
CC metabolic bone diseases. Antibodies to the LMP proteins encoded by the
CC nucleic acids are used in marker assays to identify risk factors in bone
CC degenerative diseases, such as osteoporosis. The nucleic acids are used
CC in gene therapy for bone formation which leads to the advantages of: (1)
CC lower production costs; (2) greater efficacy compared to extracellular
CC treatment regiments due to the ability to achieve prolonged expression of
CC the intracellular signal; (3) by-passing the possibility that treatment
CC with extracellular signals might be hampered due to the presence of
CC limiting numbers or receptors for those signals; (4) permitting the
CC delivery of transfected potential osteoprogenitor cells directly to the
CC site where localised bone formation is required; and (5) permitting
CC systemic bone formation, which provides a treatment regimen for
CC osteoporosis and other metabolic bone diseases. The present sequence
CC represents a reverse transcriptase PCR primer which is used in an example
CC from the present invention

PT Nucleic acid molecule encoding banana fruit associated promoter and melon
PT actin promoter, useful for producing transgenic fruit-bearing plants.
XX
PS Example 1; Page 35; 72pp; English.
XX
CC The present sequence is a PCR primer which was used to isolate and
CC amplify the promoter of the banana fruit-associated TRX (also known as
CC the G1A) gene. This was isolated from a banana library using differential
CC display analysis for banana-specific transcripts. The promoters of the
CC invention can be used to produce transgenic fruit, with altered or
CC improved characteristics, in particular their ripening, their nutritional
CC content and the expression of useful proteins

PT   Evaluating a cellular response to an environmental compound, for use in
PT   toxicological analysis, involves determining or comparing the expression
PT   levels of at least one endogenous gene.
XX
PS   Example 3; Page 27; 77pp; English.
XX
CC   The sequence represents a downstream PCR primer used in a DDRT-PCR
CC   experiment (and in cDNA synthesis), demonstrating the method of the
CC   invention. The method relates to evaluating a cellular response to an
CC   environmental compound, comprising determining or comparing the
CC   expression levels of at least one endogenous gene e.g by differential
CC   display of reverse transcribed mRNAs by PCR (DDRT-PCR). The method can be
CC   adapted to identify compounds that act on the level of endogenous gene
CC   expression through activating nuclear receptors. The method is useful in
CC   toxicological analysis, diagnostics, for diagnosing cancer (e.g.
CC   testicular, breast, prostate and endometrium), asthma, hypospadia,
CC   cryptorchism and/or allergy, and for evaluating the efficiency of a
CC   treatment for hormonal deficiency or hormonal replacement therapy, in a
CC   human such as a post-menopausal female. The method is also useful for
CC   identifying environmental chemicals or pharmaceutical compositions that
CC   interact with endocrine systems, and for detecting chemicals that pose a
CC   health threat. Expression levels of endogenous genes are determined
CC   rapidly using a sensitive technique, and the expression of any gene can
CC   be monitored. The assays are far more informative than the currently used
CC   assays, and significantly reduces the number of animals required for the
CC   testing, as it is expected that essentially all the animals in a test
CC   group will respond to the compound

PT   Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
PT   useful for detecting specific nucleic acids, e.g. for single-nucleotide
PT   mismatch discrimination.
XX
PS   Disclosure; Page 101; 105pp; English.
XX
CC   The present sequence is that of an oligonucleotide (ODN)-minor groove
CC   binder (MGF) complex. MGBs bind in a non-intercalating manner to the
CC   minor groove of non-single-stranded DNA, RNA or their hybrids. ODN-MGB-LF
CC   conjugates of the invention also comprise a latent fluorophore (LF),
CC   which binds similarly to the MGB but in an intercalating manner, or lies
CC   in the minor groove, or is oriented in some other way to the DNA molecule
CC   by MGB, such that it becomes fluorescent (or its fluorescent properties
CC   change detectably). The conjugates are used as hybridisation probes and
CC   amplification primers for fluorescent detection of specifically
CC   hybridising sequences, for analysis or diagnosis, especially (real-time)
CC   PCR, for single-nucleotide mismatch discrimination, target or signal
CC   amplification, array-based assays and sequencing, including detection of
CC   double-stranded DNA by triplex formation

XX
CC   The present sequence is that of an oligonucleotide (ODN)-minor groove
CC   binder (MGF) complex. MGBs bind in a non-intercalating manner to the
CC   minor groove of non-single-stranded DNA, RNA or their hybrids. ODN-MGB-LF
CC   conjugates of the invention also comprise a latent fluorophore (LF),
CC   which binds similarly to the MGB but in an intercalating manner, or lies
CC   in the minor groove, or is oriented in some other way to the DNA molecule
CC   by MGB, such that it becomes fluorescent (or its fluorescent properties
CC   change detectably). The conjugates are used as hybridisation probes and
CC   amplification primers for fluorescent detection of specifically
CC   hybridising sequences, for analysis or diagnosis, especially (real-time)
CC   PCR, for single-nucleotide mismatch discrimination, target or signal
CC   amplification, array-based assays and sequencing, including detection of
CC   double-stranded DNA by triplex formation

PT   Conjugate of oligonucleotide, minor groove binder and latent fluorophore,
PT   useful for detecting specific nucleic acids, e.g. for single-nucleotide
PT   mismatch discrimination.
XX
PS   Disclosure; Page 58; 105pp; English.
XX
CC   The present sequence is that of the oligonucleotide (ODN) component of an
CC   ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the
CC   invention. MGBs bind in a non-intercalating manner to the minor groove of
CC   non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly
CC   but in an intercalating manner, or lies in the minor groove, or is
CC   oriented in some other way to the DNA molecule by MGB, such that it
CC   becomes fluorescent (or its fluorescent properties change detectably).
CC   The conjugates are used as hybridisation probes and amplification primers
CC   for fluorescent detection of specifically hybridising sequences, for
CC   analysis or diagnosis, especially (real-time) PCR, for single-nucleotide
CC   mismatch discrimination, target or signal amplification, array-based
CC   assays and sequencing, including detection of double-stranded DNA by
CC   triplex formation. Many different targets can be detected a single
CC   reaction vessel. The present ODN-MGB-LF conjugate was used to demonstrate
CC   hybridisation-triggered fluorescence. Upon hybridisation to the
CC   complementary target sequence there was an increase in fluorescence
CC   yield, measured as the ratio of the fluorescence emitted by the hybrid
CC   between the ODN-MGB-LF conjugate and its target sequence to the
CC   fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF,
CC   of 8.3

PT   Human tumor suppressor protein and the encoding polynucleotide useful for
PT   treating cancer, and vector comprising the polynucleotide useful for
PT   suppressing proliferation of cancer cells.
XX
PS   Example 1; Page 34; 37pp; English.
XX
CC   The present sequence is that of a primer used for the differential
CC   display of a human cervical cancer suppressor 1 (HCCS-1) gene fragment
CC   (see ABA02555 and ABA02558) from normal exocervical tissue. The gene
CC   encodes the HCCS-1 protein (see ABB04180). The specification describes a
CC   tumour suppressor protein, HCCS-1, and the polynucleotide that encodes
CC   it. The invention has cytostatic activity. HCCS-1 acts as a tumour
CC   suppressor by inducing apoptosis of the cancer cell. An expression vector
CC   containing the inventive HCCS-1 gene may be used to suppress the
CC   proliferation of cancer cells by inducing apoptosis. The invention also
CC   provides a pharmaceutical composition for treating or preventing cancer
CC   which comprises the inventive tumour suppressor gene

PT   Expression cassette comprises promoters with basal promoter activity
PT   operably linked to a heterologous polynucleotide, useful for expression
PT   genes in suspensor cells in plants and/or basal region of plant embryo.
XX
PS   Example; Page 54; 114pp; English.
XX
CC   The present invention relates to expression cassettes comprising a
CC   promoter sequence and a promoter polynucleotide with basal promoter
CC   activity, where the promoter sequence is operably linked to a
CC   heterologous polynucleotide, and when the expression cassette is inserted
CC   into a plant, the heterologous polynucleotide is specifically expressed
CC   in a suspensor cell and/or basal region of a plant embryo. The invention
CC   also provides polynucleotide sequences encoding Scarlet runner bean
CC   (Phaseolus coccineus) G564 and C541 proteins for use in the expression
CC   cassettes of the invention. The expression cassettes comprising promoters
CC   and promoter control elements are useful for modulating transcription of
CC   genes in a plant suspensor cell and/or basal region of a plant embryo.
CC   The present sequence represents an anchor/reverse reverse transcriptase
CC   (RT)-PCR primer used in the examples of the present invention

PT   New E2 genes and proteins, useful for identifying or manufacturing agents
PT   for controlling insulin resistance syndrome or related disorders, e.g.
PT   non-insulin dependent diabetes mellitus, dyslipidemia or atherosclerosis.
XX
PS   Example 3; Page 19; 52pp; English.
XX
CC   The invention relates to the regulation of metabolism and in particular
CC   to a gene named E2 involved in insulin resistance syndrome. E2 gene and
CC   protein are useful for identifying therapeutic agents for controlling
CC   insulin resistance syndrome and other related disorders. They are
CC   particularly useful in manufacturing compositions or pharmaceutical for
CC   controlling the disorders. Particularly, the chemical compound or
CC   composition is useful for controlling insulin resistance syndrome and
CC   other related disorders, e.g. non-insulin dependent diabetes mellitus
CC   (NIDDM), dyslipidaemia, obesity or atherosclerosis. The present sequence
CC   is a PCR primer used to amplify mouse E2 cDNA

PT   Sensitively detecting proximity changes in a system that utilizes an
PT   interacting fluorophore and quencher, for high sensitivity applications,
PT   involves utilizing a metal surface as quencher.
XX
PS   Example 3; Page 30; 62pp; English.
XX
CC   The present sequence is that of a perfectly matched target sequence for a
CC   molecular beacon comprising an oligonucleotide probe (see ABL57069)
CC   covalently attached at the 3' end to fluorescent dye and at the 5' end to
CC   a nanoparticle. In the native state, the probe forms a hairpin
CC   conformation with hybridised termini. The proximity of the fluorophore
CC   and quencher (gold nanoparticle) in the molecular beacon results in
CC   little or no detectable fluorescence. Upon hybridisation of the central
CC   complementary stretch of the probe to a target sequence, such as the
CC   present sequence, the hairpin undergoes a conformational change resulting
CC   in an increase in fluorescence, the extent of which is proportional to
CC   the amount of target sequence present. Single mismatches can be detected.
CC   The invention relates generally to the use of metal surface quenchers
CC   such as particles or films for high sensitivity applications in, for
CC   example, detection and diagnostic systems

PT New targets expressed in embryonic cell but not in non-diseased somatic
PT cell, useful in medicine for diagnosis and/or therapy, and for
PT identifying an agent capable of inhibiting the action of the target.
XX
PS Example 1; Page 54; 77pp; English.
XX
CC The invention relates to a new target for use in medicine which is
CC expressed and/or present at a high level in an embryonic cell, is not
CC expressed or is expressed and/or present at low level in a non-diseased
CC somatic cell and is not expressed in or is expressed and/or present at a
CC low level in a diseased somatic cell. The target is useful in the
CC preparation of a medicament for treating a disease, particularly cancer.
CC The human embryonic cells (oocytes, pre-implantation embryos, germ cells,
CC embryonal carcinoma cells and/or embryonic stem cells) are useful in
CC identifying targets re-expressed in cancer cells for preventing, treating
CC or curing cancer. The target may be used in medicine for diagnosis and/or
CC therapy, and to identify an agent capable of inhibiting the action of the
CC target. This sequence represents a PCR primer used to amplify target cDNA

PT New isolated polynucleotide encoding E4 gene involved in insulin
PT resistance syndrome, useful for identifying chemical compound useful for
PT controlling e.g. non-insulin dependent diabetes mellitus.
XX
PS Example 3; Page 19; 46pp; English.
XX
CC The invention relates to an isolated polynucleotide (I) molecule
CC comprising a nucleotide sequence which encodes an E4 polypeptide (II) or
CC its fragment of at least 10 amino acids. (II) is useful for identifying a
CC chemical compound capable of modulating the activity of E4 by contacting
CC the chemical compound with (II) or a transgenic non-human mammal and
CC measuring any effect of chemical compound on the activity of (II) or
CC transgenic non-human mammal, where the identifying method is useful for
CC making a pharmaceutical composition, which comprises mixing the compound
CC thus identified with a carrier, and the compound is preferably an
CC antibody that is useful for controlling insulin resistance syndrome and
CC other related disorders such as non-insulin dependent diabetes mellitus
CC (NIDDM), dyslipidaemia, obesity, and atherosclerosis. The present
CC sequence represents a PCR primer used to isolate the coding sequence of
CC mouse E4 protein

PT   Inhibiting neoplastic cellular proliferation and/or transformation of a
PT   mammalian cell, by using Pituitary tumor transforming gene carboxy-
PT   terminal peptides.
XX
PS   Example 1; Page 65; 190pp; English.
XX
CC   The patent discloses pituitary tumour transforming gene (PTTG) carboxy
CC   terminal peptides. The invention also relates to methods for inhibiting
CC   neoplastic cellular proliferation and transformation (NP/T) of mammalian
CC   cells. The method involves delivering a composition comprising a PTTG
CC   carboxy-terminal-related polynucleotide, an expression vector comprising
CC   a polynucleotide encoding PTTG C-terminal (PTTG-C) peptide, PTTG-C
CC   peptide to a mammalian cell that overexpresses PTTG. The compositions
CC   comprising PTTG-C peptides are useful for inhibiting neoplastic cellular
CC   proliferation and/or transformation of a mammalian cell. PTTG-C peptides
CC   are useful in bioassays, as immunogens to produce anti-PTTG-C antibodies
CC   and in therapeutic compositions. PTTG antibodies are also useful for
CC   inhibiting the activation of mammalian T-lymphocytes. Sequences of the
CC   invention are used as vaccines and in gene therapy. The present sequence
CC   is a PCR primer which is used for amplifying rat PTTG1 cDNA

PS Disclosure; Page 4; 34pp; Korean.
XX
CC The present invention describes DNA sequences relating to anti-cancer
CC drug resistance. The DNA sequences can be used as a component of a kit or
CC a DNA chip for detecting the presence of anti-cancer resistance. The
CC method for identifying and sequencing the DNA sequences comprises
CC obtaining an anti-cancer sensitive cancer tissue and an anti-cancer drug
CC resistant cancer tissue from patients suffering from lung cancer and head
CC and neck cancer, isolating mRNAs from the tissues, preparing cDNAs of the
CC tissues from mRNAs using reverse transcriptase; finding genes showing the
CC increase or decrease of gene expression in the cancer tissues before and
CC after the anti-cancer drug treatment using differential display of
CC polymerase chain reaction (PCR), subjecting the genes to electrophoresis,
CC amplifying the cDNAs by using PCR, sub-cloning the amplified cDNAs into
CC pGEM-Teasy plasmid, and sequencing the cDNA using an auto-sequencing
CC machine. The present sequence represents an oligonucleotide which is used
CC in the exemplification of the present invention

PT tumours.
XX
PS Example 1; Page 61; 175pp; English.
XX
CC The present invention describes a method for inhibiting neoplastic
CC cellular proliferation and/or transformation of a mammalian cell. The
CC method comprises delivering to a mammalian cell that endogenously over
CC expresses pituitary tumour transforming gene (PTTG1), a composition
CC comprising, an expression vector comprising a promoter and a
CC polynucleotide, where the polynucleotide comprises a first DNA segment
CC encoding a mammalian PTTG2 peptide the polynucleotide being operatively
CC linked to the promoter in a transcriptional unit, where PTTG2 is selected
CC from: (a) a peptide (I) consisting essentially of a 191 amino acid
CC sequence (see ABB79058) or a functional fragment comprising at least
CC amino acid residues 1-180; or (b) a mammalian PTTG2 peptide having at
CC least 95% sequence homology with (I). The expression vector is complexed
CC with a cellular uptake-enhancing agent such that the PTTG2 peptide is
CC expressed in the cell where neoplastic cellular proliferation and/or
CC transformation of the cell is inhibited. PTTG2 protein regulates
CC transactivating activity by PTTG1 and that PTTG2 peptide molecules have
CC the ability to down regulate PTTG1 gene expression and/or PTTG1 protein
CC function in a negative manner. The method is useful in inhibiting
CC neoplastic cellular proliferation and/or transformation of mammalian
CC cells both in vivo and in vitro. The method is also useful in treating
CC malignant tumours. The present sequence represents an anchor primer used
CC in the isolation of PTTG cDNA, which is used in an example from the
CC present invention

PT   Inhibiting the activation of a mammalian T-lymphocyte cell useful for
PT   treating immune-related disorders by inhibiting PTTG1 gene expression.
XX
PS   Example 21; Page 182; 185pp; English.
XX
CC   The invention relates to inhibiting the activation of a mammalian T-
CC   lymphocyte cell comprising inhibiting pituitary tumour transforming gene
CC   (PTTG1) expression and/or endogenous PTTG1 protein function in the T-
CC   lymphocyte cell, whereby activation of the T-lymphocyte cell is
CC   inhibited. PTTG upregulates bFGF secretion and transactivates DNA
CC   transcription. Compositions and methods of the invention are useful for
CC   inhibiting neoplastic and non-neoplastic proliferation of mammalian T-
CC   lymphocyte cells, including activated normal lymphocytes and transformed
CC   lymphocytes. The compositions and methods are useful in the prevention or
CC   inhibition of xenograft or allograft rejection and in the treatment of
CC   allergic, asthmatic and/or autoimmune conditions such as systemic lupus
CC   erythematosus (SLE), autoimmune myasthenia gravis, rheumatoid arthritis,
CC   autoimmune encephalomyelitis, psoriasis, atherosclerosis and other
CC   autoimmune diseases. The inventive methods and compositions are also
CC   useful in the treatment of T-cell neoplasias, such as leukaemia, or any
CC   haematologic or lymphopoietic neoplasm e.g. Hodgkin's disease. The
CC   present sequence is that of a PTTG encoding polynucleotide sequence

PT   Expressing LIM mineralization protein in non-osseous mammalian cell for
PT   treating intervertebral disc injury, by transfecting cell with nucleic
PT   acid encoding LIM mineralization protein operably linked to promoter.
XX
PS   Example 9; Page 74; 94pp; English.
XX
CC   The present sequence is that of H-T11G, an MMLV-RT primer that was used
CC   in differential display PCR of RNA extracted from glucocorticoid-
CC   stimulated rat osteoblasts. cDNA (see ACC58339) encoding rat LIM
CC   mineralization protein (RLMP), a cytokine involved in mineralization of
CC   the bone matrix and in the differentiation of cells into the osteoblast
CC   lineage was subsequently isolated. The invention provides methods of
CC   expressing LIM mineralization protein in non-osseous mammalian cells,
CC   such as stem cells or intervertebral disc cells. The methods involved
CC   transfecting the cells with a nucleic acid encoding LIM mineralization
CC   protein operably linked to a promoter. Expression of the LIM
CC   mineralization protein can stimulate proteoglycan and/or collagen
CC   production for treatment of disc disease associated with trauma or disc
CC   degeneration, e.g. for enhancement of bone repair in fractures and bone
CC   defects, in bone grafting, and in the treatment of osteoporosis

PT   New spermatogenesis associated factor DNA, useful in diagnosing cancer,
PT   in designing selective cancer therapy by targeting this gene product, and
PT   in basic research on carcinogenesis and differentiation.
XX
PS   Example; Page 3; 42pp; English.
XX
CC   The invention relates to a purified spermatogenesis associated factor
CC   (SPAF, an AAA-protein family member (ATPase associated with diverse
CC   cellular activities)) DNA molecule designated SPAF DNA, which is a gene
CC   that is altered and overexpressed in poorly differentiated squamous cell
CC   carcinoma as compared with normal parental epidermal cells. The gene is
CC   naturally expressed in testes, and expresses a spermatogenesis associated
CC   protein by translation of the SPAF DNA molecule. The protein is an SPAF
CC   protein, which is naturally localised in spermatogonia and primary
CC   spermatocyte up to early pachytene stage. Also included are a SPAF cDNA
CC   molecule having a DNA sequence which is complementary DNA sequence to the
CC   novel SPAF DNA, an anti-SPAF antibody, diagnosing cancer (comprising: (a)
CC   contacting a cell with a specific probe comprising SPAF cDNA and
CC   detecting a reaction; or (b) contacting a cancer cell with an anti-SPAF
CC   antibody, and detecting reaction to the antibody), isolating the SPAF
CC   gene by contacting the gene with SPAF cDNA or with anti-SPAF antibody,
CC   diagnosing infertility by contacting a testes generated cellular material
CC   with an anti-SPAF antibody, a chemotherapeutic agent comprising an
CC   antibody to SPAF protein conjugated with a tumour binding inhibiting
CC   material and a vector containing a testes specific nucleic acid
CC   comprising at least a portion of the novel SPAF DNA. SPAF is useful in
CC   diagnosing cancer, in designing selective cancer therapy by targeting
CC   this gene product, and in basic research on carcinogenesis and
CC   differentiation. The SPAF protein, peptide, mRNA and cDNA may be used in
CC   designing drugs for treatment and prevention of abnormal development and
CC   tumours, and for fertility and/infertility/contraception. The present
CC   sequence is a reverse transcriptase (RT)-PCR primer used in an RNA
CC   differential display experiment for mouse SPAF mRNA

PT   Human cervical cancer 2 proto-oncogene for diagnosing cancer.
XX
PS   Example 2; Page 24; 26pp; English.
XX
CC   The present sequence is that of H-T11G-anchored oligo-dT primer, which
CC   was used in an example from the invention in the RT-PCR amplification of
CC   RNA obtained from healthy cervical, primary cervical cancer and
CC   metastatic common iliac lymph node tissues, and from a human cervical
CC   cancer cell line. A partial clone (CG401) was obtained, which was used to
CC   identify a full-length cDNA (see ABZ58393) for novel human cervical
CC   cancer 2 (HCC-2) proto-oncogene. Differential display RT-PCR using the
CC   oligo-dT primer showed that CG401 was expressed in cervical cancer
CC   tissue, metastatic lymph node tissues and CUMC-6 cells, but not in normal
CC   tissues. HCC-2 proto-oncogene can be used in the diagnosis of various
CC   cancers, in the production of transgenic animals useful for drug
CC   screening, in the production of HCC-2 protein, and in the construction of
CC   an antisense gene (claimed) useful in antisense gene therapy

PT   Detecting polynucleotides, for pharmacogenetic testing, comprises
PT   contacting a target polynucleotide with a complementary single-stranded
PT   sensor polynucleotide and an agent that allows the sensor to fluoresce
PT   upon excitation.
XX
PS   Example 1; Page 25; 41pp; English.
XX
CC   The invention relates to a novel assay for detecting a polynucleotide in
CC   a sample, which comprises: contacting a sample suspected of containing a
CC   target polynucleotide with a predetermined single-stranded sensor
CC   polynucleotide complementary to the target polynucleotide, in a solution
CC   comprising an agent that is a nonaqueous solvent that allows the sensor
CC   polynucleotide to produce a detectable fluorescence emission; exciting
```

CC the sensor polynucleotide; and determining fluorescence emission. The
CC assay is useful for detecting a single or double-stranded target
CC polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a
CC wide variety of different applications including pharmacogenetic testing,
CC forensic testing to identify the species or individual which was the
CC source of a forensic specimen, in anthropological setting, paternity
CC testing, testing for compatibility between prospective tissue or blood
CC donors and patients and in screening for hereditary disorders. The method
CC is also useful to study alterations of gene expression in response to a
CC stimulus, disease, drug or medication, and other applications include
CC human population genetics, analyses of human evolutionary history and
CC characterisation of human haplotype diversity. The method is useful for
CC detecting polynucleotide sequences from contaminants or pathogens
CC including bacteria, yeast, and viruses to detect single nucleotide
CC polymorphisms, which may be associated with particular alleles or subsets
CC of alleles. The method is useful for detection of mutations and to detect
CC nucleotide sequences associated with increased risk of diseases or
CC disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia.
CC This polynucleotide sequence represents an oligonucleotide sequence used
CC in a fluorescence technique of the invention

PT Detecting polynucleotides, for pharmacogenetic testing, comprises
PT contacting a target polynucleotide with a complementary single-stranded
PT sensor polynucleotide and an agent that allows the sensor to fluoresce
PT upon excitation.
XX
PS Example 1; Page 25; 41pp; English.
XX
CC The invention relates to a novel assay for detecting a polynucleotide in
CC a sample, which comprises: contacting a sample suspected of containing a
CC target polynucleotide with a predetermined single-stranded sensor
CC polynucleotide complementary to the target polynucleotide, in a solution
CC comprising an agent that is a nonaqueous solvent that allows the sensor
CC polynucleotide to produce a detectable fluorescence emission; exciting
CC the sensor polynucleotide; and determining fluorescence emission. The
CC assay is useful for detecting a single or double-stranded target
CC polynucleotide, such as, DNA or RNA in a sample. The assay finds use in a
CC wide variety of different applications including pharmacogenetic testing,
CC forensic testing to identify the species or individual which was the
CC source of a forensic specimen, in anthropological setting, paternity
CC testing, testing for compatibility between prospective tissue or blood
CC donors and patients and in screening for hereditary disorders. The method
CC is also useful to study alterations of gene expression in response to a
CC stimulus, disease, drug or medication, and other applications include
CC human population genetics, analyses of human evolutionary history and
CC characterisation of human haplotype diversity. The method is useful for
CC detecting polynucleotide sequences from contaminants or pathogens
CC including bacteria, yeast, and viruses to detect single nucleotide
CC polymorphisms, which may be associated with particular alleles or subsets
CC of alleles. The method is useful for detection of mutations and to detect
CC nucleotide sequences associated with increased risk of diseases or
CC disorders including cystic fibrosis, Tay-Sachs, and sickle-cell anaemia.
CC This polynucleotide sequence represents an oligonucleotide sequence used
CC in a fluorescence technique of the invention

```
CC   The present invention relates to a method for detecting interactions
CC   between biological components using a nonlinear optical technique. The
CC   invention is used for screening candidate binding partner(s) for binding
CC   to test molecule. It can also be used to detect changes in orientation or
CC   conformation of the probe and/or target. The present sequence is a target
CC   oligonucleotide used in nonlinear optical technique

XX
CC   The present invention relates to a method for providing a profile of mRNA
CC   molecules present in a sample. The method comprises generating two
CC   independent patterns characteristic of the population of mRNA molecules
CC   expressed in the sample and analysing the patterns using a combinatorial
CC   algorithm, comparing gene expression by different or same cell types
CC   under different conditions, and identifying genes having a role in
CC   various cellular processes. The method is useful for the analysis and
CC   identification of transcribed genes, and fingerprinting. The method can
CC   be used to identify genes which play a role in determining various
CC   cellular processes, including susceptibility to external factors,
CC   development, and disease. The present sequence for a PCR primer is used
CC   in the production of a single pattern characteristic of a sample,
CC   employing a Type IIS restriction enzyme (i.e. FokI) in the methods of the
CC   present invention

PT   New zinc finger-containing proteins and nucleic acids, useful in
PT   manufacturing a medicament for treating or preventing a disorder
PT   associated with decreased or increased expression or activity of MDZ3,
PT   MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX
PS   Example 8; SEQ ID NO 5257; 103pp; English.
XX
CC   The present invention relates to novel human zinc finger-containing
CC   proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC   encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC   MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC   15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC   or in manufacturing a medicament for treating or preventing a disorder
CC   associated with decreased or increased expression or activity of MDZ3,
CC   MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC   acids and proteins are also useful for diagnosing or monitoring a disease
CC   caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC   acids can also be used as probes to detect and characterize gross
CC   alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC   useful in constructing microarrays for measuring gene expression. The
CC   proteins are useful as therapeutic agents for gene therapy or as
CC   vaccines. The present sequence was used to illustrate the invention.

PT   Determining polyadenylation sites within transcribed gene sequences
PT   present in a sample comprises assigning to gene fragments gene candidates
PT   within a database by comparing signals in the dataset with the database.
XX
PS   Example; Fig 3; 81pp; English.
```

```
XX
CC   The invention relates to determining the presence of and/or identifying a
CC   polyadenylation site within a sequence of a transcribed gene or variants
CC   present in a sample. The method involves assigning to gene fragments gene
CC   candidates within a database by comparing signals in the dataset with the
CC   database, the database comprising data representing mRNAs with known
CC   polyA sites and/or 'virtual genes' representing a possible
CC   polyadenylation site within an actual gene. The method is useful for
CC   determining the presence of and/or identifying a polyadenylation site or
CC   alternative polyadenylation sites within a sequence of a transcribed gene
CC   or sequences of transcribed gene variants present or potentially present
CC   in a sample, in identifying gene features, particularly in identifying
CC   differences between sequence variants that occur in a population of
CC   nucleic acid molecules, especially in identifying or discovering polyA
CC   site usage or determining polyA site usage in a nucleic acid sample, and
CC   gene variants arising from alternative polyA sites. The present sequence
CC   represents a double stranded product DNA fragment

XX
PT   Producing a population of double-stranded product DNA molecules, useful
PT   for mRNA profiling, comprises amplification by nested polymerase chain
PT   reaction.
XX
PS   Example; Fig 2; 105pp; English.
XX
CC   The invention relates to producing a population of double-stranded
CC   product DNA molecules comprising amplification by a nested PCR method.
CC   The method is useful in profiling mRNA transcribed in a system under
CC   investigation. The oligonucleotides are used as size standards in
CC   electrophoresis, and as internal controls allowing for calculation of
CC   relative amounts of material present. The present sequence represents a
CC   double stranded product DNA, which aids in outlining an approach to
CC   production of a single pattern characteristic of a sample, employing a
CC   type II restriction enzyme (FokI)

PT   Peptides having at least two new nucleotides - useful as primers in RT-
PT   PCR.
XX
PS   Disclosure; Page 11; 19pp; Japanese.
XX
CC   This sequence represents a primer of the invention. The invention relates
CC   to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta
CC   -N3'; or (X)m5'-(gamma)k-delta-N3'; where X = a labelled compound and/or
CC   a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n =
CC   natural number indicating the repetition of alpha; beta, delta = V or N;
CC   V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or
CC   thymine; gamma = thymine; k = natural number of 3 or over indicating the
CC   repetition of gamma, in which thymine expressed by gamma is composed of
CC   1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are
CC   useful as primers for RT-PCR and determination of base sequences. The new
CC   sequences allow for reproductive and highly efficient analysis of gene
CC   sequences

XX
PS Example 3; Page 91; 187pp; English.
XX
CC AAZ36739-41 represent oligo(dT) primers used for modified differential
CC display, in the method of the invention. The specification describes a
CC method for measuring the level of two or more nucleic acid molecules in a
CC target. The method comprises contacting a probe with an arbitrarily or
CC statistically sampled target and detecting the amount of specific binding
CC of the target to the probe. The methods can be used to identify
CC differentially expressed nucleic acid molecules associated with disease
CC states, such as cancer, autoimmune disease, infectious disease, aging,
CC developmental disorder, proliferative disorder or neurological disorder.
CC Alternatively the methods can be used to assess the efficacy or toxicity
CC of or a resistance to a treatment. Also the methods can be used to
CC determine differential expression of nucleic acid molecules in response
CC to a stimulus, e.g. a chemical, drug or growth factor (especially
CC epidermal growth factor), radiation, stress or a pathogen. The methods
CC can also be used to determine co-regulated genes that can be potential
CC targets for drug discovery

PT New nucleic acids that interact, and optionally cleave, target sequences,
PT used to treat cancer.
XX
PS Claim 77; Page 79; 148pp; English.
XX
CC The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphoro(di)thioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.

```
CC   AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC   sequences, and AAA26107 to AAA26218 represent their corresponding target
CC   sequences. AAA26219 to AAA26271 represent other ribozyme sequences and

PT of allergic diseases and screening drug candidates.
XX
PS Example 6; Page 49; 77pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 419 which
CC exhibits reduced expression in the T-cells of individuals with high cedar
CC pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from
CC T-cells from individuals allergic to cedar pollen using the differential
CC display method. Pollinosis-associated gene 419 has homology with the gene
CC encoding human Fas-associated factor-1 (FAF-1). The invention also
CC relates to the protein encoded by pollinosis gene 419; expression
CC constructs and host cells comprising pollinosis- associated gene 419
CC nucleic acids; pollinosis-associated gene 419 primers and probes;
CC antibodies against the protein encoded by the gene; methods of detection
CC of pollinosis-associated gene 419 nucleic acids; and a method of
CC diagnosis of allergic diseases via the detection of pollinosis-
CC associated gene 419 nucleic acids. The invention additionally encompasses
CC methods of screening drug candidates for the treatment of allergic
CC disease by measuring the expression of pollinosis-associated gene 419 in
CC pollen antigen-stimulated T-cells in the presence of a test compound
CC relative to a control.Pollinosis-associated gene 419 is useful in the
CC diagnosis of allergic diseases and in the screening of drug candidates
CC for the treatment of such diseases. The present sequence represents a PCR
CC primer used in the isolation of human pollinosis-associated gene 419 cDNA

PT Pollinosis-associated gene 795 undergoing significantly low expression in
PT subjects with high cedar pollen-specific IgE levels, useful in diagnosis
PT of allergic diseases and screening drug candidates.
XX
PS Page 45; Example 6; 73pp; Japanese.
XX
CC The invention relates to the human pollinosis-associated gene 795 which
CC exhibits significantly reduced expression in the T-cells of individuals
CC with high cedar pollen-specific IgE (immunoglobulin E) levels. The gene
CC was isolated from T-cells from individuals allergic to cedar pollen using
CC the differential display method. Pollinosis-associated gene 795 has
CC homology with the human vimentin gene. The invention also relates also
CC relates to the protein encoded by pollinosis gene 795; to expression
CC constructs and host cells comprising pollinosis-associated gene 795
CC nucleic acids; pollinosis-associated gene 795 primers and probes;
CC antibodies against the protein encoded by the gene; methods of detection
CC of pollinosis-associated gene 795 nucleic acids; and a method of
CC diagnosis of allergic diseases via the detection of pollinosis-associated
CC gene 795 nucleic acids. The invention additionally encompasses methods of
CC screening drug candidates for the treatment of allergic disease by

```
CC   measuring the expression of pollinosis-associated gene 795 in pollen
CC   antigen-stimulated T-cells in the presence of a test compound relative to
CC   a control. Pollinosis-associated gene 795 is useful in the diagnosis of
CC   allergic diseases and in the screening of drug candidates for the
CC   treatment of such diseases. The present sequence represents a PCR primer
CC   used in the isolation of human pollinosis-associated gene 795 cDNA

PT Evaluating a cellular response to an environmental compound, for use in
PT toxicological analysis, involves determining or comparing the expression
PT levels of at least one endogenous gene.
XX
PS Example 3; Page 27; 77pp; English.
XX
CC The sequence represents a downstream PCR primer used in a DDRT-PCR
CC experiment (and in cDNA synthesis), demonstrating the method of the
CC invention. The method relates to evaluating a cellular response to an
CC environmental compound, comprising determining or comparing the
CC expression levels of at least one endogenous gene e.g by differential
CC display of reverse transcribed mRNAs by PCR (DDRT-PCR). The method can be
CC adapted to identify compounds that act on the level of endogenous gene
CC expression through activating nuclear receptors. The method is useful in
CC toxicological analysis, diagnostics, for diagnosing cancer (e.g.
CC testicular, breast, prostate and endometrium), asthma, hypospadia,
CC cryptorchism and/or allergy, and for evaluating the efficiency of a
CC treatment for hormonal deficiency or hormonal replacement therapy, in a
CC human such as a post-menopausal female. The method is also useful for
CC identifying environmental chemicals or pharmaceutical compositions that
CC interact with endocrine systems, and for detecting chemicals that pose a
CC health threat. Expression levels of endogenous genes are determined
CC rapidly using a sensitive technique, and the expression of any gene can
CC be monitored. The assays are far more informative than the currently used
CC assays, and significantly reduces the number of animals required for the
CC testing, as it is expected that essentially all the animals in a test
CC group will respond to the compound

XX
CC The invention relates to a method for examining allergic diseases
CC comprises determining the expression level of a gene containing, the
CC human cDNA appearing as ABK49633 which has homology with
CC acetyltransferases in the eosinophils of a patient and comparing the
CC expression level with that in the eosinophils of a healthy individual
CC (i.e. differential display). Also included are methods of screening for
CC candidate compounds which affect the expression level of the gene or the
CC activity of the protein encoded by the gene (including related proteins
CC and mutants), the use of probes based on the gene sequence in the
CC examination of allergic diseases, the use of reporter constructs in the
CC screening of candidate compounds, a vector containing a the transcription
CC -controlling region of the gene, cells transformed with the vector, an
CC antibody against the protein and a model animal for allergic diseases
CC which is a transgenic non-human vertebrate with lowering of expression
CC intensity of the gene in eosinophils. The method is examining allergic
CC diseases particularly atopic dermatitis which is also applicable in
CC screening candidate compounds for remedies. Such method can be performed
CC in high throughput, at low cost. The present sequence is a differential
CC display PCR primer for the cDNA encoding the human acetyltransferase-like
CC protein 20-90-05

CC   The present invention relates to a method for examining allergic diseases
CC   which involves determining the expression level of a gene, having one of
CC   the 17 nucleotide sequences shown in ABN99812-ABN99828, in the
CC   eosinophils in a patient and comparing the expression level with that in
CC   the eosinophils of a healthy individual. The method can be used to
CC   examine allergic diseases, particularly atopic dermatitis, and its early
CC   diagnosis, which is also applicable in screening candidate compounds for
CC   remedies. The present sequence is a PCR primer described in the
CC   exemplification of the invention
